Appendix D	Charts	294
Epilogue		301

Foreword

May you live your life
As if the maxim of your actions
Were to become Universal Law

Immanuel Kant

I am sitting before this blank screen, waiting to see what will appear, perhaps another book. You have an advantage from where you are, because if you are reading this, then indeed the book was written and you are holding it in your hands as proof. But from my vantage point, I don't know if these few words will continue to flow out onto this screen and become what you are holding. I haven't seen or held it; it is only a possibility at this point in time.

Yet it is a paradox of sorts isn't it, because indeed you are holding it now. Maybe we will look at this paradox; maybe we will look at these two "*now's*", the one I am in presently, and the one you are in presently. Mine will be call the past for you, and yours is called the future for me.

Can I really understand what is happening here, or do I fall back into my old ways of making sense out of time and what is apparently happening in it, because if you asked me right now to give you a good definition of what time is, I'm not so sure I could. You see, I am in time (I think) but it is always moving, and I can't seem to hold onto it long enough to figure it out. When I look at the past, it is somehow gone, and the future is somehow not here, so all that is really here is right now and this right now seems to be moving away into that thing we just called the past. Hmm, interesting that this seems so illusive, or perhaps we could say illusory. Oh well!

Later we will look at some ideas about time, but the main focus of this book will be about the Law of Vibration and more particularly about how the Law of Vibration can help me trade more successfully, make more money, have more fun, and enjoy the trading experience in a more abundant way.

So how can we understand this process of just starting with an idea, a preliminary thought, and see it become the real thing. Just noticing the first thoughts about writing a book and then in time it becomes a book. What is the sequence of events that will happen for this book to get from this single thought to a real book in my and your hands?

What we will use to understand how this can and does happen is an old ancient set of concepts, handed down through the centuries. At first to only the privileged few who had access to them and then in secret societies, religions and enlightened selective parts of civilizations; each containing their own version in many different and colorful explanations. Yet each had the essential key and brought about the same results when it was in accordance with the vibrational nature of creation.

What you find here in this book will work, if you want it too. If you are looking for a specific way, and have a preconceived notion of what it must be like, you may not find that here. What is here is a specific viewpoint of what we are calling the Law of Vibration. It is a very simple law, it is not difficult or complex, it is made such that everything and everyone can use it. It is the natural way things are created, but we seldom recognize the similarity of nature to ourselves. We seem to think we are smarter because we can think. Everything else doesn't waste its time thinking such egoic thoughts of self aggrandizement; it just follows the simple way

When we are willing to open to what is simple, the world becomes simple, but as long as we are on a quest of finding it all out, we will accumulate a lot of stuff on the way. A lot of different ways to do what we think we want to do. We can think trading is a difficult experience; needing to find the right way, the Holy Grail if you will, and so we spend a lot of time looking instead of simply doing it with a simple way.

The first part of the book is about the finding it "out there", perhaps not the simplest way. The second part of the book introduces the "in here" description of what this Law of Vibration is. You decide, you find your way and that is all that matters.

Part 1

The External

Introduction to Part One

The External

This is the nature of genius,
To be able to grasp the knowable
Even when no one else
Recognizes that it is present

Deepak Chopra
1946 -

There are two parts to this book in describing the Law of Vibration because there are basically two approaches to life. These two approaches are what I will call the outward and inward. Infinity extends outward as far as you want to go, past galaxies and black holes and beyond the edges we give to this big Universe out there. Infinity also extends inwardly as far as we want to go past molecules, atoms, quarks or whatever we choose to call the latest limit we have found, but it always goes beyond.

I don't intend to re-define the limits of the Universe inward or outward but because we do live in a vibrational world and vibrations are a result of the polarity of energy (of out and in, up and down) then we would do well to consider both and then from that vantage point decide what serves us best in this moment.

So the first part of the book will be about the external journey (going outside of our self) and looking for the path to what we want to do and experience. This will include journeys of gifted and influential thinkers from the past, of past knowledge that seems to work for a lot of people and so should work for us. This will provide possibilities for us to follow in their footsteps or to pattern our own journey from the insight they

provided. This will be the natural, practical, scientific view of vibration and how it abides the laws, how it provides an avenue to giving us what we want.

The reason we are reading this book or doing anything is to get what we want. A desire moves us, and our movement through the pages of this book is because we are looking for something, we are looking for something we want to find more of, to bring us our desire. So before we start it would be good for each of us to know what it is that we want. It's hard to find something unless we know what it is; take the time to decide what you want.

The other half of the book will focus on the inward path, going within our own nature and discovering possibilities here to use in our pursuit of what we desire to do and experience. Either or both approaches are fine, you will come to know what you desire and the way to realizing that desire will be the journey you follow. It is called life and you can't do it wrong! Pay attention to what feels good, what seems easy and somehow connected to you. Finding your effortless way to fulfilling your desire is your joy.

Within the framework of these two parts we will look at the dynamics of the trading experience, at how we can define what we want with trading, how we can realize that want and live it in the real world, not just in our imagination. We are going to look at the process of the Law of Vibration, what it is, how it works and what we can do with it. This Law affects everything we do or want to do.

Because there are two viewpoints we will be coming from, even though they are identical in their underlying structure, they appear different and we may be biased to one or the other. If we can open to allow both being ok, and seeing where we can benefit from each, we will manifest what we want in our trading experience, or in any experience as far as that goes. This is a Universal law, applicable to everything.

We are in a vibrational universe and the laws running it are available for our use when we become aware of them. We all drive easily down the freeway in our car because we all have learned what the laws are. They allow us to travel at high speeds without much concern, because when we all remain in accordance with the laws we can know what will happen. We can predict what will happen, we can enjoy the journey and have exactly what we want, as long as we agree to keep the rules.

The rules we are going to look at in this book are the keys to journeying to anyplace we want to go and having them be in sync with us as we move within the structure of the Law of Vibration, within the structure of this physical world and how it manifests and maintains physical form and time. So read with a desire to find what you want and also to be open to seeing more, that your desires may expand as you become more aware of the rest of the story.

Chapter 1

Vibrational Harmony in the Market

Unless you know what you want
You can't ask for it

Emma Albani

Let's look at the vibration of a couple of markets from the viewpoint of underlying harmonic numbers represented by price and time. This world of viewing markets with numbers is vast and could take us on an extended journey, beyond the scope of this present work, but we will look at two straight-forward examples and graphically demonstrate vibration numerically.

Remember, that the Law of Vibration is more than understanding why something is created and has more relevance to how it is. If knowing "why" is important to believing in the "how", then this knowledge is necessary and will be the basis for the belief structures to be functional. On the other hand, there are many paths leading to the same end, and we may find we have access to some of these already prepared avenues without the need for finding the "whys" to more complex possibilities. This will become more apparent as we progress through this work.

Let's begin by looking at a daily Wheat chart and see what price and time can reveal about vibrational relationships within its movements. Look at the following chart and see if you notice any indications of cyclical vibrational patterns. When you have studied the chart for a sufficient time, go to the next page.

Chart 1.0

What you did on the previous chart may be different than what I am going to do. I would suspect the odds of you seeing what I am seeing would be very slim, unless you have seen this before. So don't assume what I am doing it the right way or a better way than what you may decide to look at. There are infinite "right" ways and each will be as usable in the creation process as any.

What I am going to do first is look for some clue to an underlying harmonic that will reveal more of the nature of this particular market. One way to do this is to use repeating cycles of time, price or time/price. All will work, and some may be easier than others, but that is dependant on what you already know and if you can see it. So let's go back to Chart 1.0 on the previous page and look again for some cycles in time, or cycles in price or if you are familiar with positional space cycles (price/time) then identify these before going on.

This is a process of learning within yourself and you can become more acquainted with yourself if you have a desire to know how "you" do things. Ultimately, this is really what you are looking for, and the understanding of individual things outside yourself (like markets) will become incidental because you will have mastered creation from within, where it really is anyway.

Understanding the Law of Vibration is more of a journey within oneself, than the outward symbols we use to form our knowledge base and understanding. These external examples serve to validate what we have already come to know and believe. This knowing or belief is the foundation for our creation process and the Law of Vibration can be understood through this knowing of how creation is happening.

Understanding the creative journey of a market will reveal its path, and understanding the creative journey of "our self" will reveal every path, because we will be creating it. This is not to be read over lightly in hopes of getting to the stuff that will tell me how to make money trading. We are on the right path, but we will need to continue our looking at the "why" until our understanding is sufficient to hold our "how".

Now if you have gone back and looked for cycles again on the previous page and hopefully made some marks on the chart, (it is too easy to look at something and not remember what we looked at or what we saw). Writing something down or making a line or mark on paper will remain long enough for our investigation over time and this will help to form and put into place our creative platform we are looking for. Go on to the next page and see what direction my path took and see if it makes any sense to you.

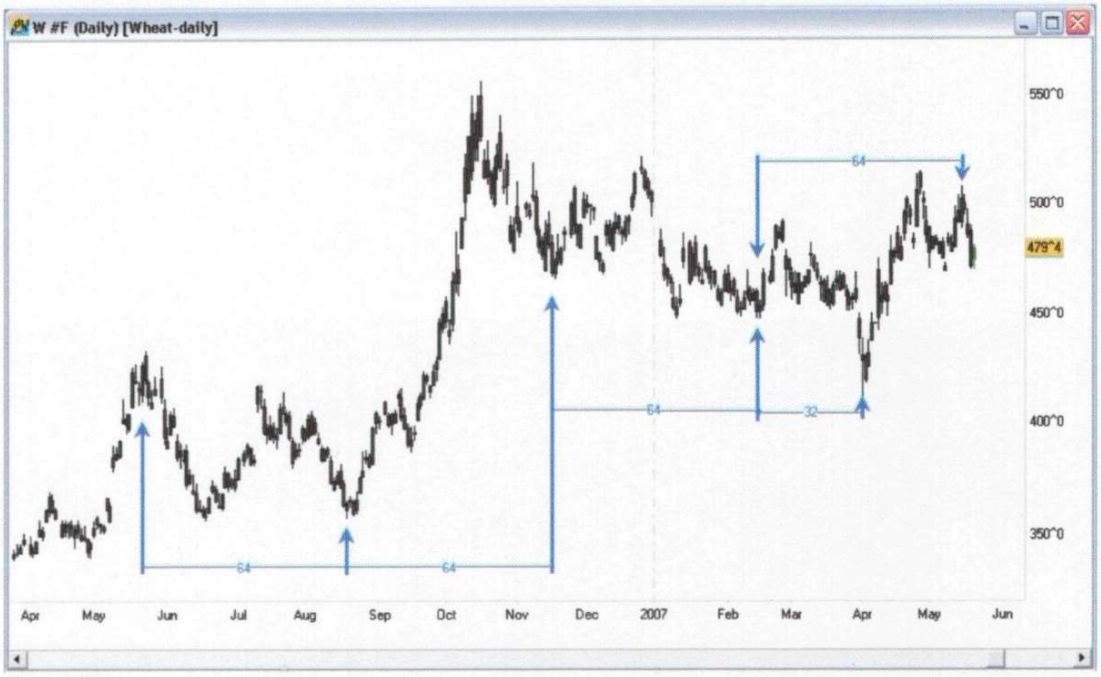

Chart 1.1

Here is the same chart with some time ratios added. It is easy to see that ratios of 64 are working within this time frame. What we can do now is scale our chart so we have a controlled environment to work with geometric shapes to find patterns.

What one has to remember is that the creation of each chart is a different representation of ratios of time and price and so the congruence of a circular form to a circular pattern will depend on the chart being squared (time and price are in working harmonic ratios of x to y). If the chart is some other ratio other than a working harmonic, then the resultant figure will be an ellipse as opposed to a circle. Because we have found a ratio of 64 occurring then we would reasonably assume a factor of 8 may work. In this case we find squaring the chart to 8X8 (8 units of price to 8 units of time) gives us a squared chart and circles show up for us graphically instead of some form of ellipse.

On the next page are a squared chart (Chart xxx) and the original chart we started with. Notice the difference between the two and see if you see why circles may not be the same shape applied to identical time price vectors on both charts..

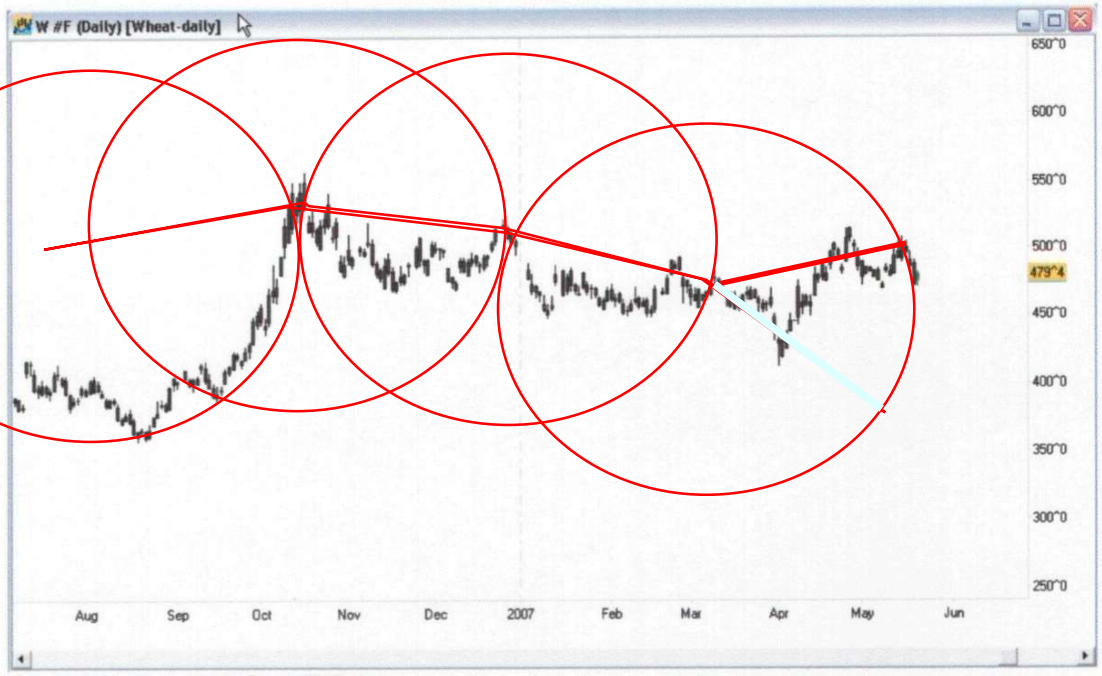

Chart 1.2 (Squared chart 8X8)

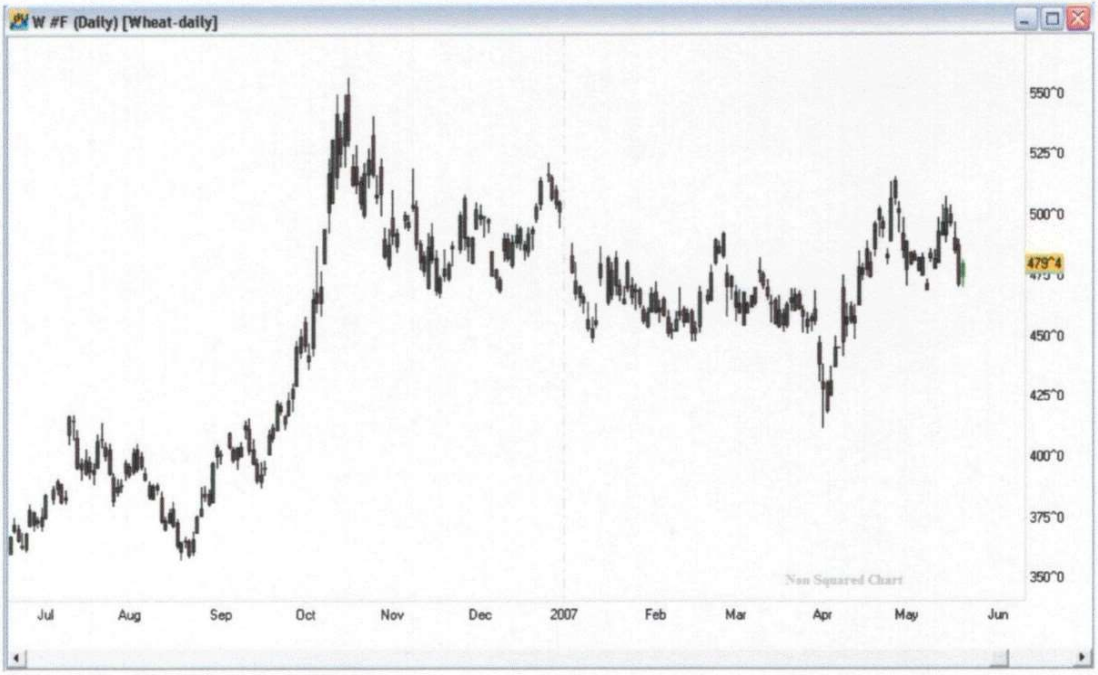

Chart 1.3 (NON-Squared Chart)

Here is a comparison of squared and non-squared, draw some circles on these before turning the page and see what you find.

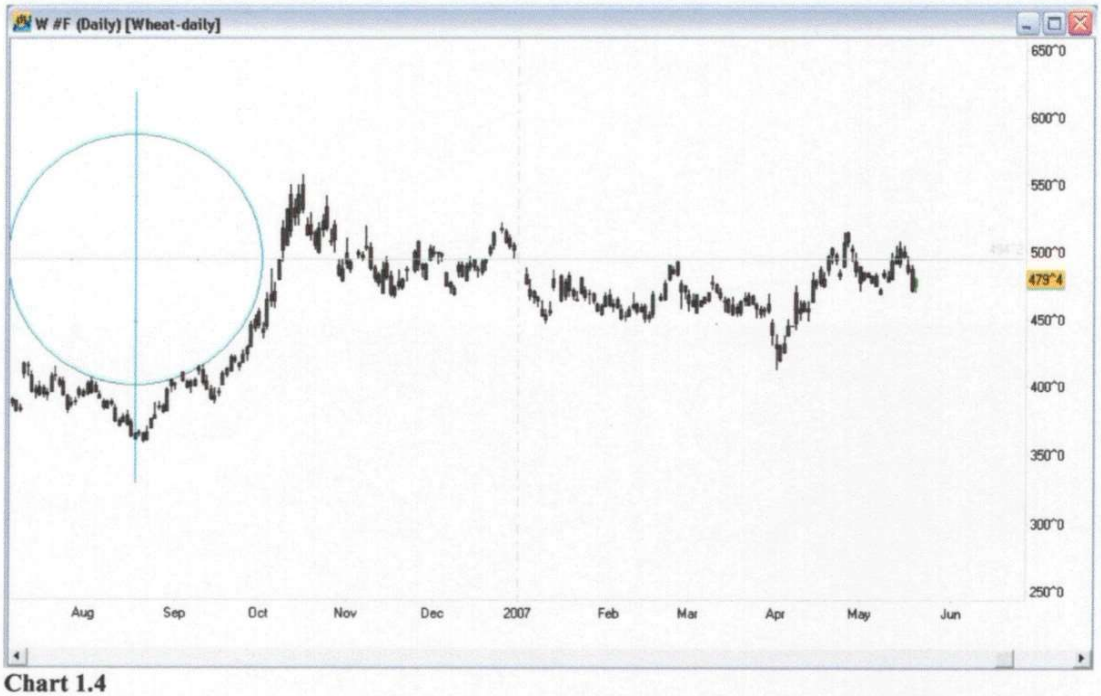

Chart 1.4

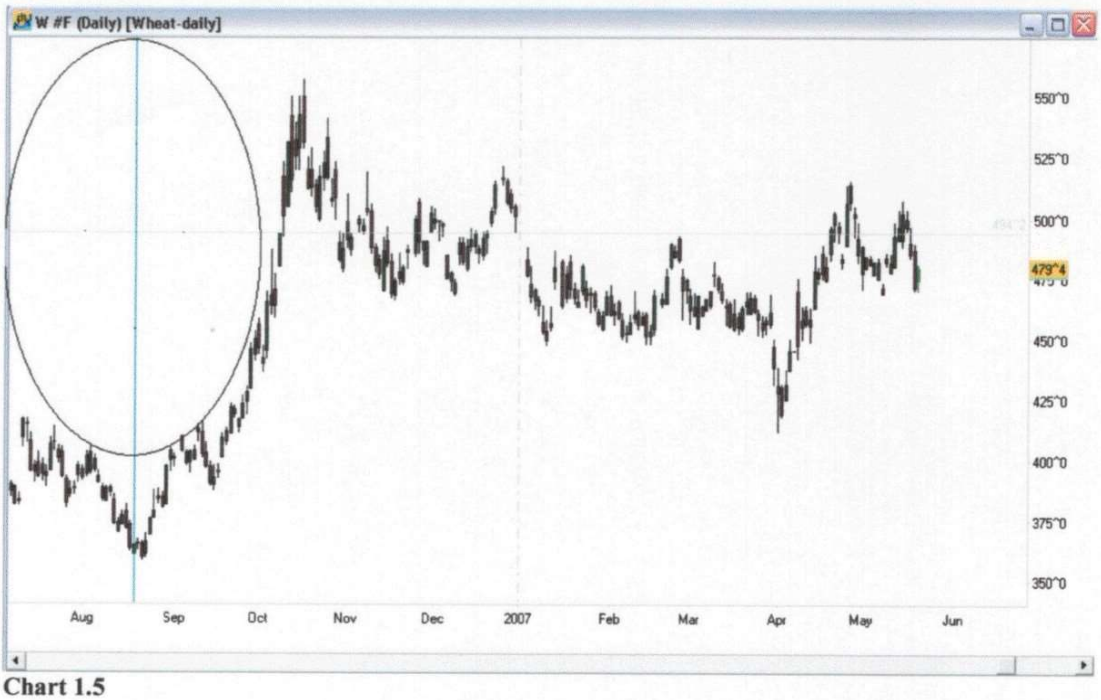

Chart 1.5

Notice how in the above squared chart (Chart 1.4) the circle set to a diameter of 64 trading days was placed on the center line low in August and price worked its way around the perimeter to the high in October. In the Non-squared chart (Chart 1.5) the circle has been distorted into an ellipse.

Here is the squared chart with a graphical approach using geometric patterns identifying spatial relationships between time and price. I am using a circle set on the center line of the low in August and fitted to price responding to the perimeter as it moves to the high in October. I am adding a second circle inside the circle at ½ the diameter for a ratio of 1 to 2. Then I'll add a second set of circles aligned with the center line of the low and at a distance of one radius from the second set. This is what it looks like.

Look at the price bars reacting to the pattern lines and notice our squared chart is providing a structure accommodating this pattern.

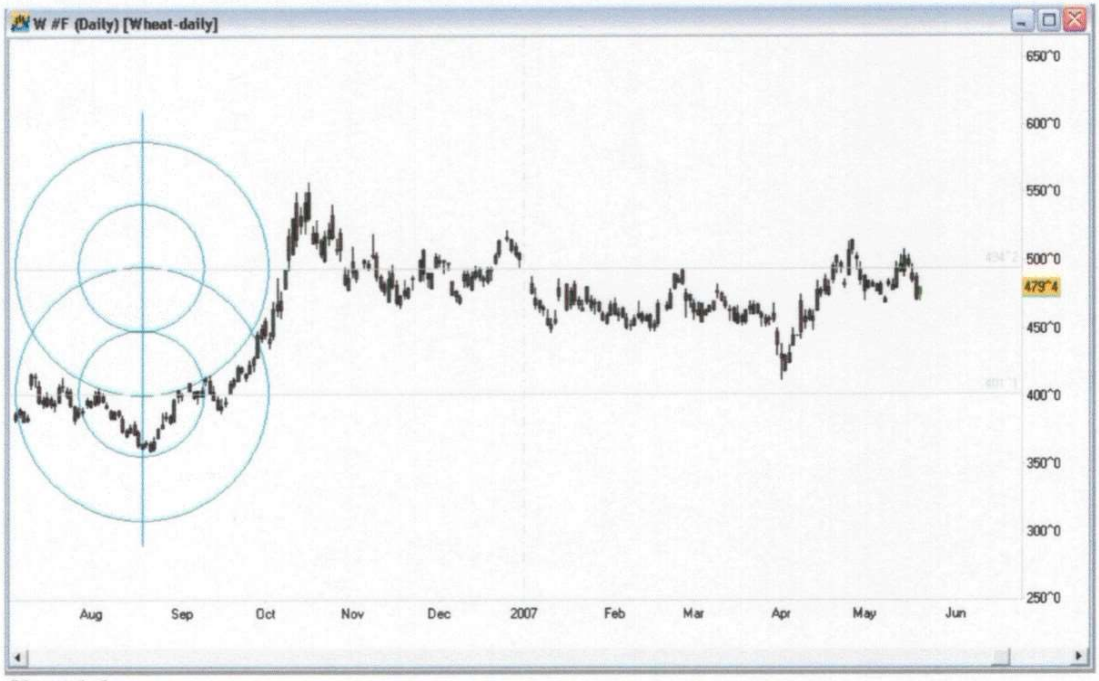

Chart 1.6

Now I'll add the rest of the matrix of this pattern of circles and see how our squared chart is responding to the geometric vibrational pattern of an 8X8 ratio.

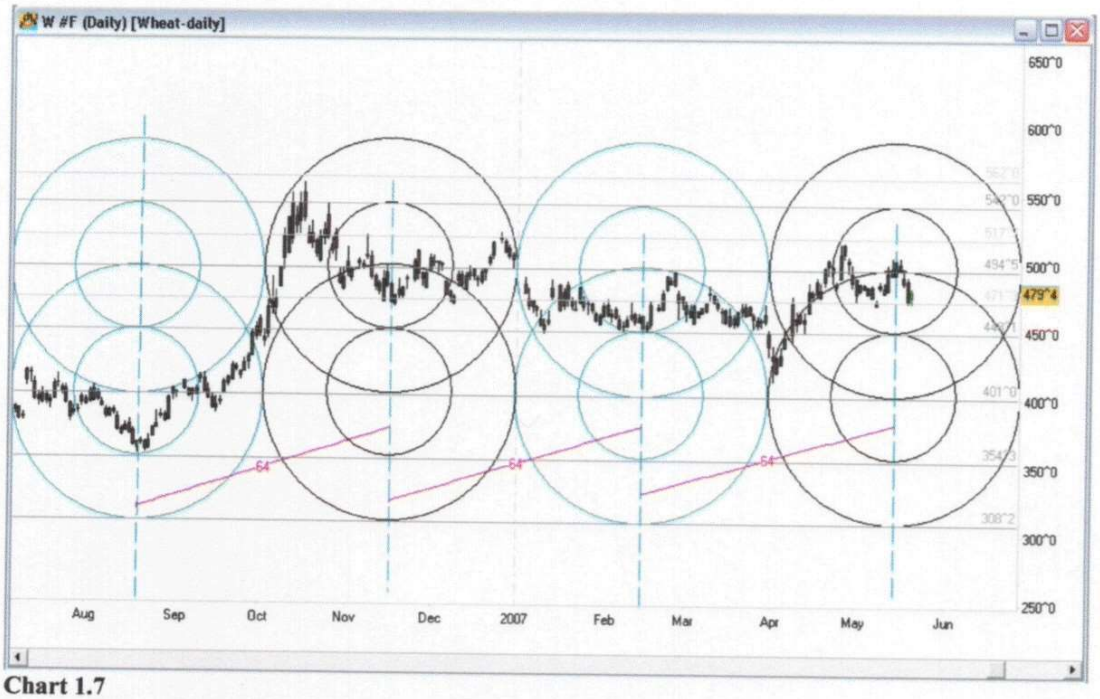

Chart 1.7

It is easy to see that this pattern is matching very well to price bar action and gives us a good structure to watch for movement within the pattern.

Another way to check for confirmation of the fit of pattern to price is to set another pattern or tool on the chart and see if it will match both the price bar movement and the underlying 8X8 matrix we are using. Give this idea some thought before you turn the page.

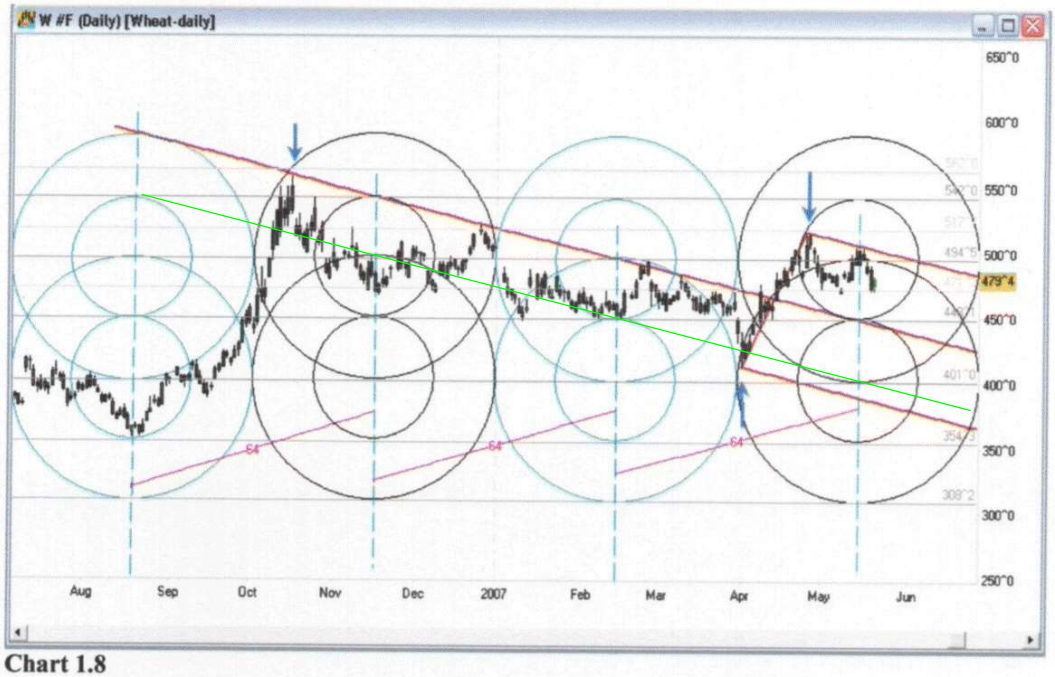

Chart 1.8

Above is a chart with an Andrews Fork placed on the low in April and the High in April and the handle of the fork placed on the previous high in October. Then look at how this is matching both the pattern and the price action of the bars in the chart below with all the hits to the handle and fork.

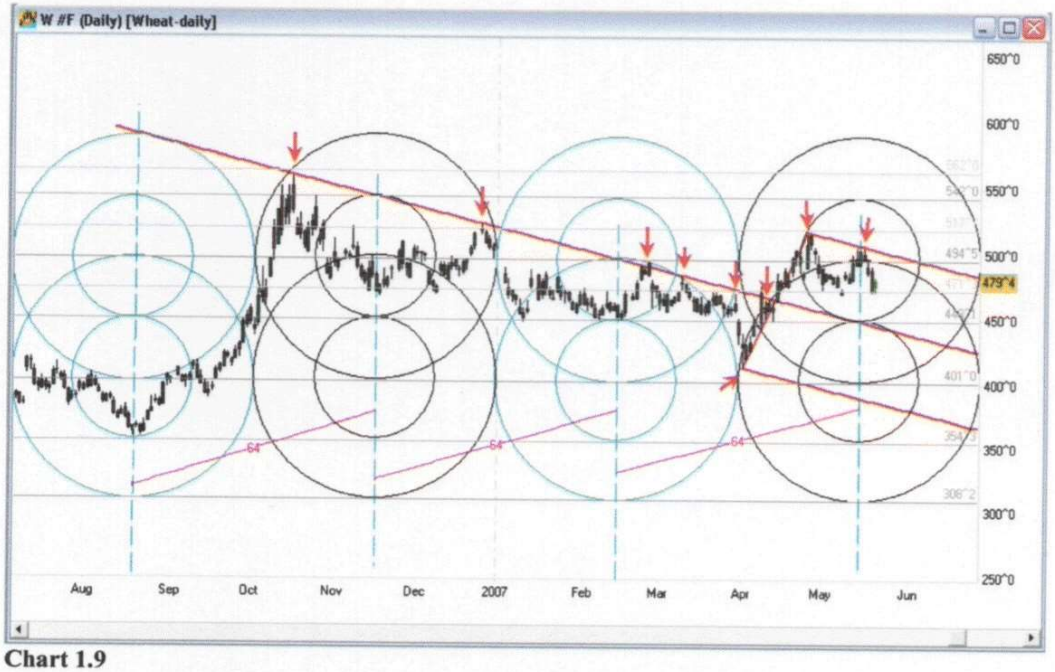

Chart 1.9

Now look at how it is responding to the pattern of 64 trading day circles.

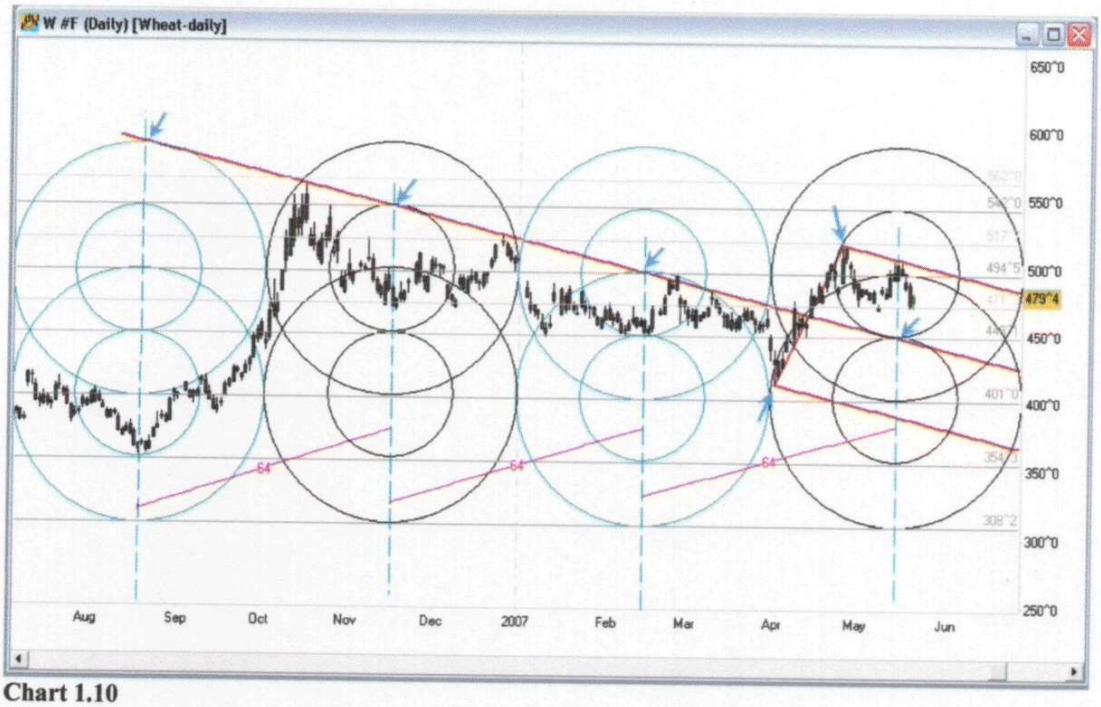

Chart 1.10

Here we see the Fork is intersecting each of the circles at the centerlines of the 64 trading day cycle and the forks corners are intersecting at the edges of the large and small circles. The Fork is fitting perfectly to the matrix pattern.

Now that we have this information let's take a look at the chart and see what else we can see. Before turning the page you may want to spend some time on this chart and see what you can see.

Here is what is happening at each of the centerlines of our pattern. Notice it is revealing a change in trend each time price gets to this part of our pattern.

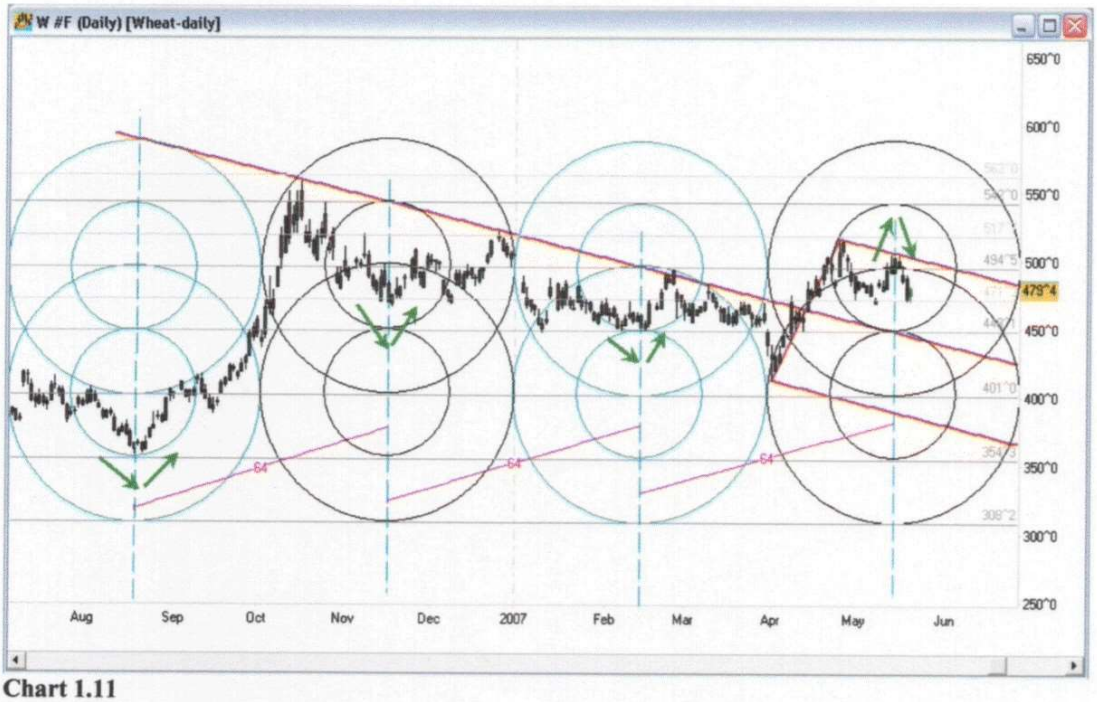

Chart 1.11

All of these previous charts were posted on the Wave59 Forum site and should still be in the archives. They were posted in real time and followed the movement of the market over many months. I will post a few more here to show the relationship of this market to the squared circle pattern, and how it is very precise in revealing price/time movement. I will jump ahead a few months and continue to repeat the circular patterns we have been following and watch as it progresses into the higher octave patterns, continuing to respond to the octaval spacing between the circumference arcs.

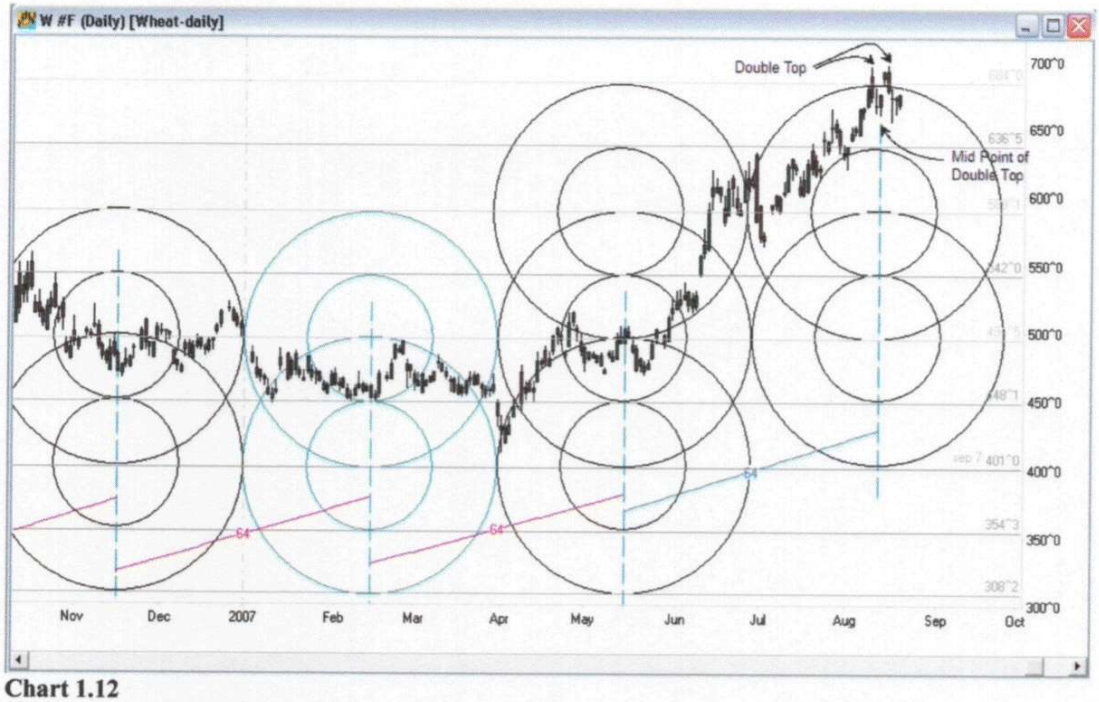

Chart 1.12

As you can see on the above chart, the 64 bar interval ended at the mid-point of the double top so far. It has also exceeded the circles topmost arc and is into the next higher circle indicating a lot of energy going with the up trend. If it breaks up again above the double top it should continue to move up. The new circles are containing the bars very well, except the double top which saw the bars over shoot into the next. However, looking at the balance point of the two tops and the mid point low, it falls exactly on the circle's arc.

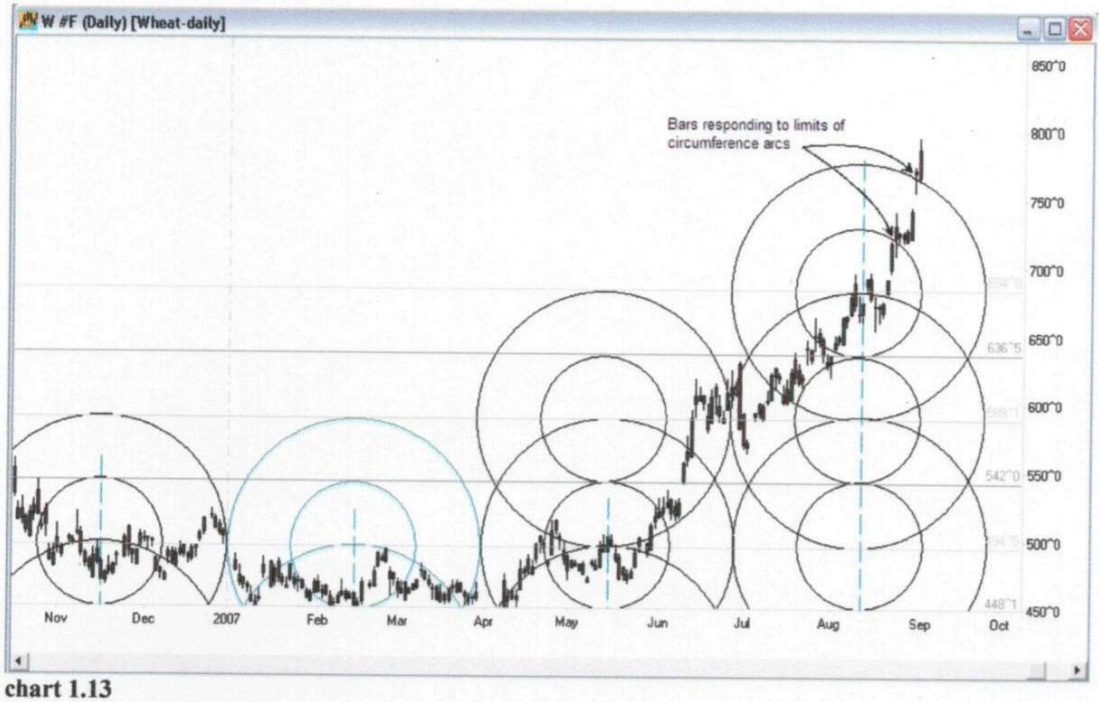

chart 1.13

Here is the next chart with a new circle added. I'm going to add circles one at a time so that it is easy to see how each interval is responding to the price bars.

The next circle added below:

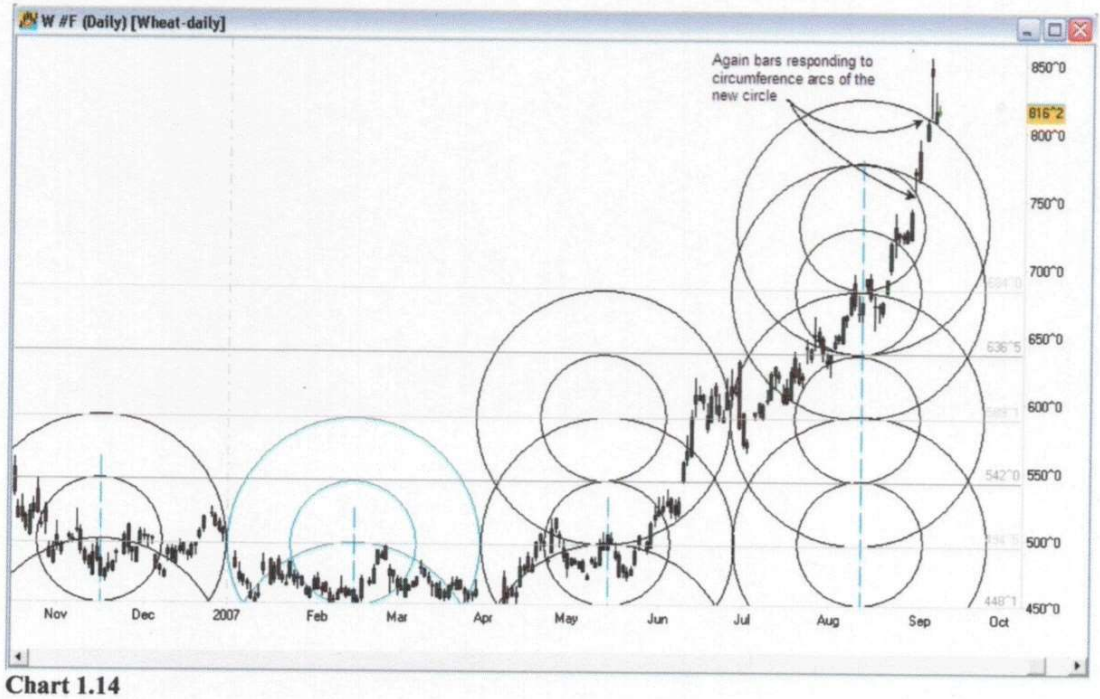

Chart 1.14

Here is the next octaval ratio circle added and price creates a top at the circumference arc. This is a series of charts that was started many months ago and it is unfolding the pattern very precisely. It is a valid harmonic pattern that is in sync with the unique energy signature of this market. It moves to this mathematical, geometrical, vibrational law. It is predictable when we know what its inherent nature is.

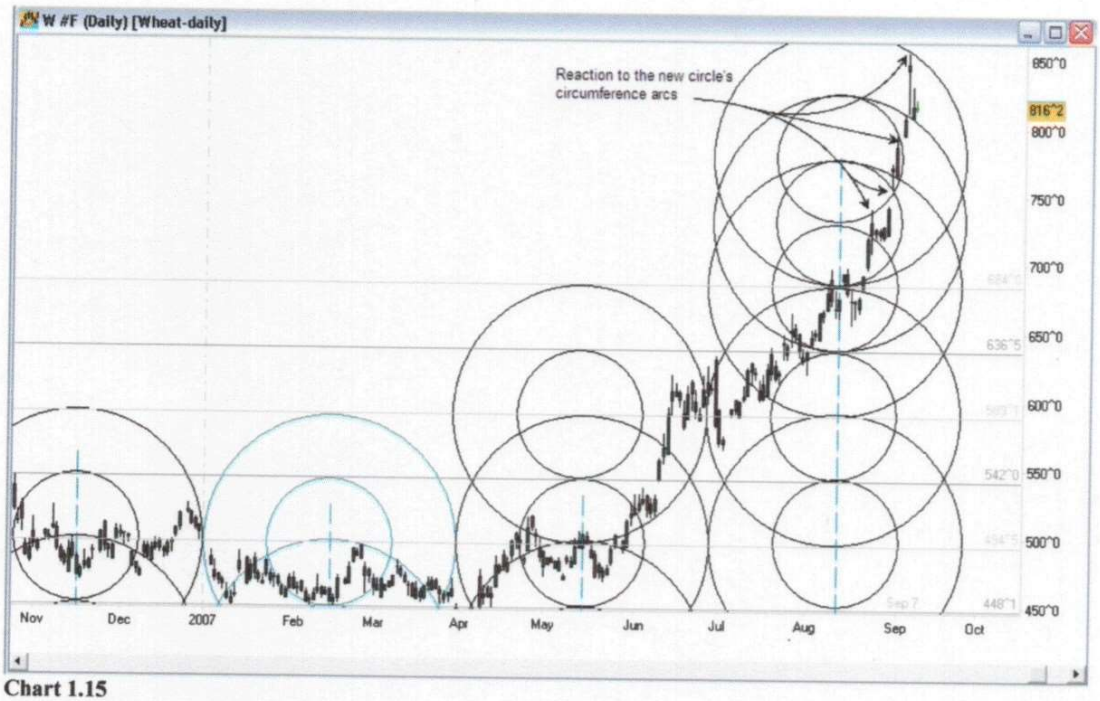

Chart 1.15

There is more happening here but I'll leave it up to you to see what else you want to find. The important thing is that we have found an underlying vibrational pattern that can be used very nicely in determining what this market is moving to.

*(*Chapter 2 has more charts for this market showing harmonic doubling and octave shells.)*

AWE

Next let's look at how a market identifies its underlying vibration at its time of birth. We'll use an example of the stock AWE (AT&T Wireless) when it first started trading on April 27, 2000 (a more detailed explanation is included in Book 1 of Secrets of Forecasting).

We will pay attention to what the first bars are revealing in the way of ratios of time and price and time/price. From this early movement a market will usually give a lot of information that is sometimes easy to see because there isn't a lot of past data to get lost in. What we see in the first few bars is all we know and so we can focus on just this and not have to sift through a lot of complexity that can accumulate over time.

Here is the daily chart of AWE from April 27, 2000 to September 2000. If you haven't paid attention to the birth of a stock or commodity, this would be a good opportunity to see what you can see before going on to what I see, understanding your awareness process is more important to you than understanding mine. When you have studied the chart then turn the page.

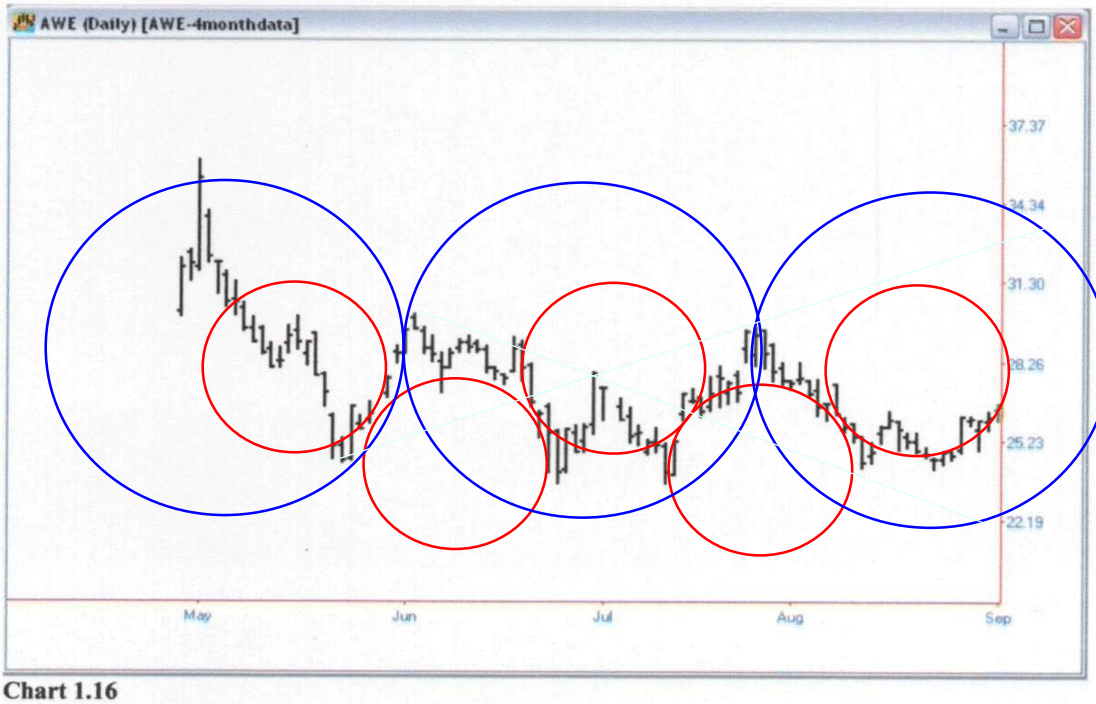

Chart 1.16

Here is what happened on the first three bars, price moved up from $30.00 per share to $36.00 per share, a move of $6.00 in 3 trading days. Already we are seeing the possibility of a ratio of 3 and 6.

Then price moved down $12.00 from the $36.00 high to the $24.00 low over the next 15 trading days. So from the first low ($30.00) to the next low ($24.00) is an 18 trading day move and a movement in price of $6.00 down. So we have $6.00 up in 3 trading days and $6.00 move down in 18 trading days and both time and price are ratios of 6. This is a good clue to investigate if this market is vibrating to ratios of 6.

Again looking at the chart below, we see the May 1st high to the first of June high is 24 trading days and a difference of $6. 24 and 6 are ratios of 6. The May 1st high to the mid June high is 36 trading days and just failing to reach the $30.00 level. Again very close to both being ratios of 6.

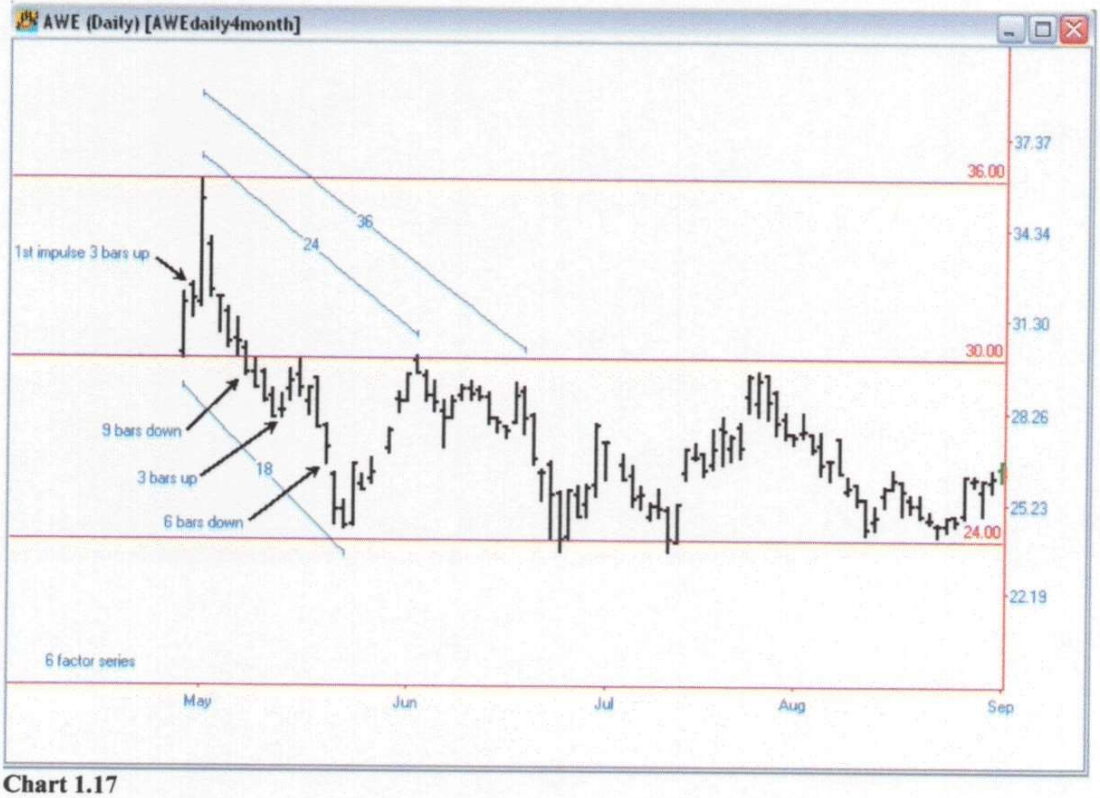

Chart 1.17

Here is another chart showing the ratios of 6 to price and time (trading days).

Chart 1.18

In the previous charts we see that AWE is vibrating in time (trading days) to ratios of six (6). Now we want to look at a chart with calendar days and see if the vibration is also working in calendar days instead of just bar counts. We will measure time between highs and lows and the price ratios will be the same as in the trading day chart so we won't have to repeat this process. Here is a chart with calendar days.

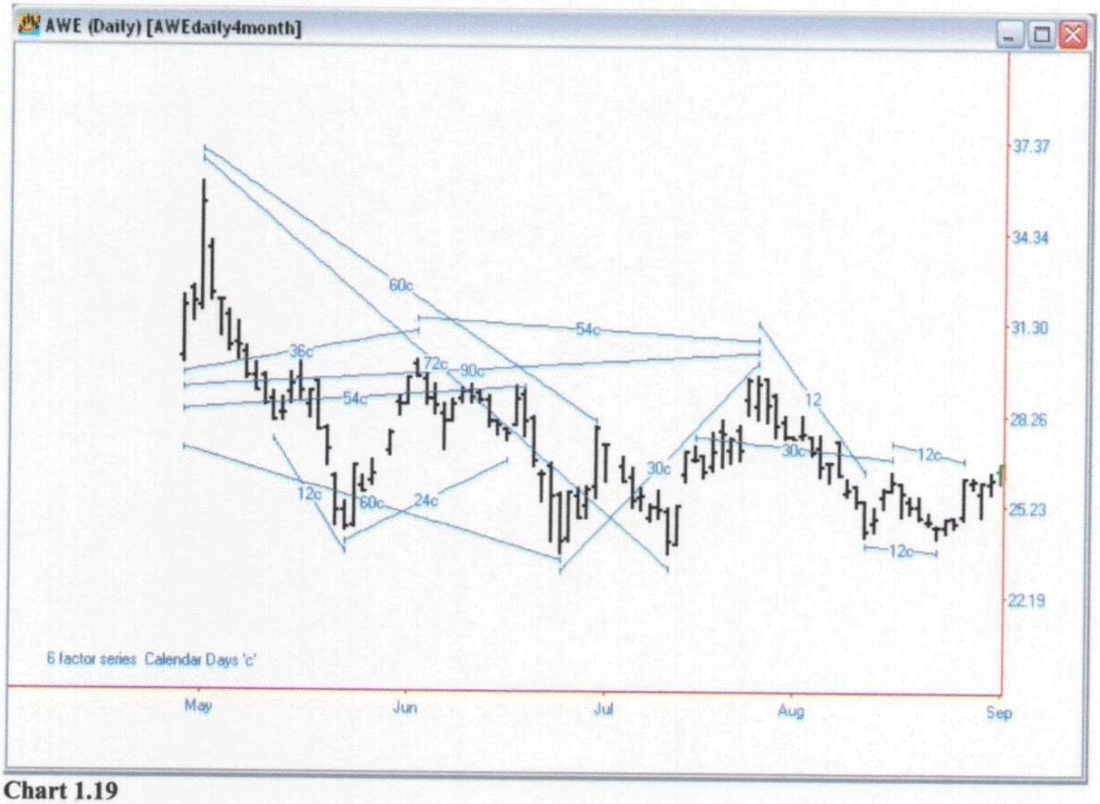

Chart 1.19

Again this shows we are vibrating very strongly ratios of 6.

On the next page are two longer term charts; one is showing ratios of 36 and one showing the yearly cycle of 360. It is evident that from the initial three bar move of $6.00 back in April of 2000, the vibrational harmonic was identified.

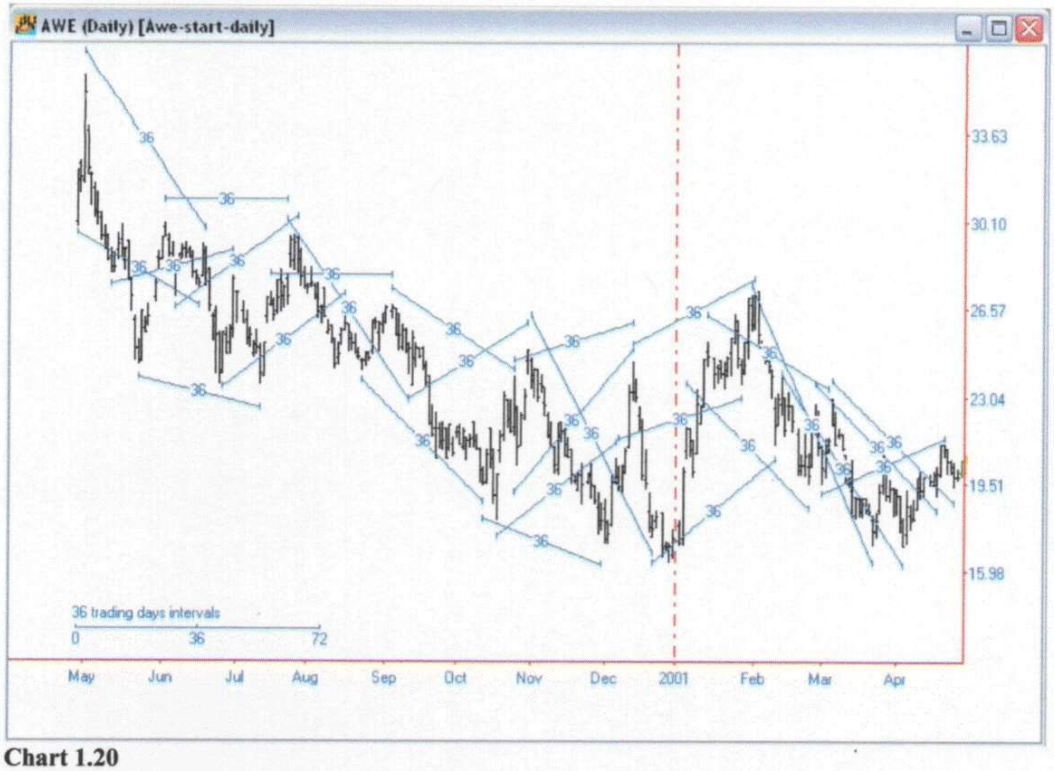

Chart 1.20

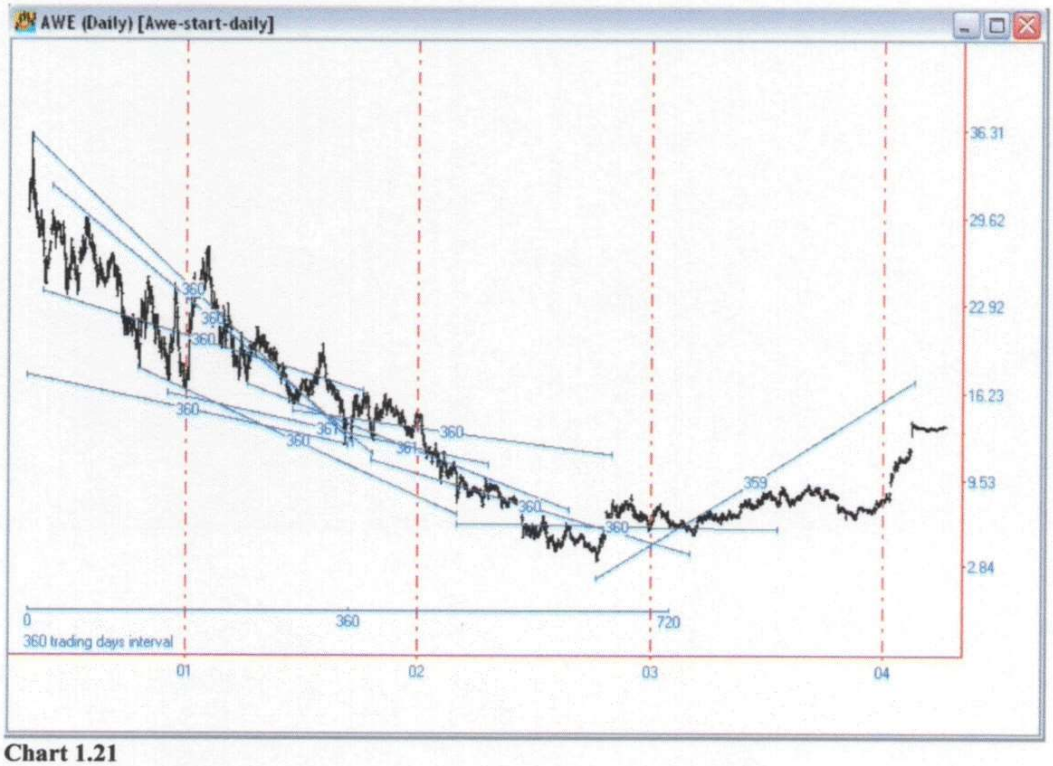

Chart 1.21

Chapter 2

Octave Shells and Harmonic Doubling in the Market

Nothing can come out of nothing
Any more than a thing
Can go back to nothing

Marcus Aurelius

In the previous chapter we looked at cycles and underlying harmonics as identified on a price/time chart with geometric patterns and number ratios. Here in this chapter we will extend this some more and look at octaval shells and more ratio intervals using a different pattern. These are the external evidence of the Law of Vibration and are found in an unlimited number of ways, but it is important to believe in the external as a way of understanding the internal.

We will use the Wheat market, looking at a weekly chart over several years. Take the time to see it "your way" as well as understanding what I will talk about. Some ways of seeing will be easier for you than others, so watch for your natural (or easy) way.

Here is a weekly chart, make some notes of what you see and what you would do with it, before going on to the next page. Life only shows us new things once, after that we see them in a different way; we see them with the thoughts of what we think about them. Watch how you decide what you will think about this new chart. It's a clue to knowing where you are and how to change if you want to.

As you read further in the book you will see how this internal understanding is the underpinning of our creative platform for using the Law of Vibration. So take your time and enjoy the journey.

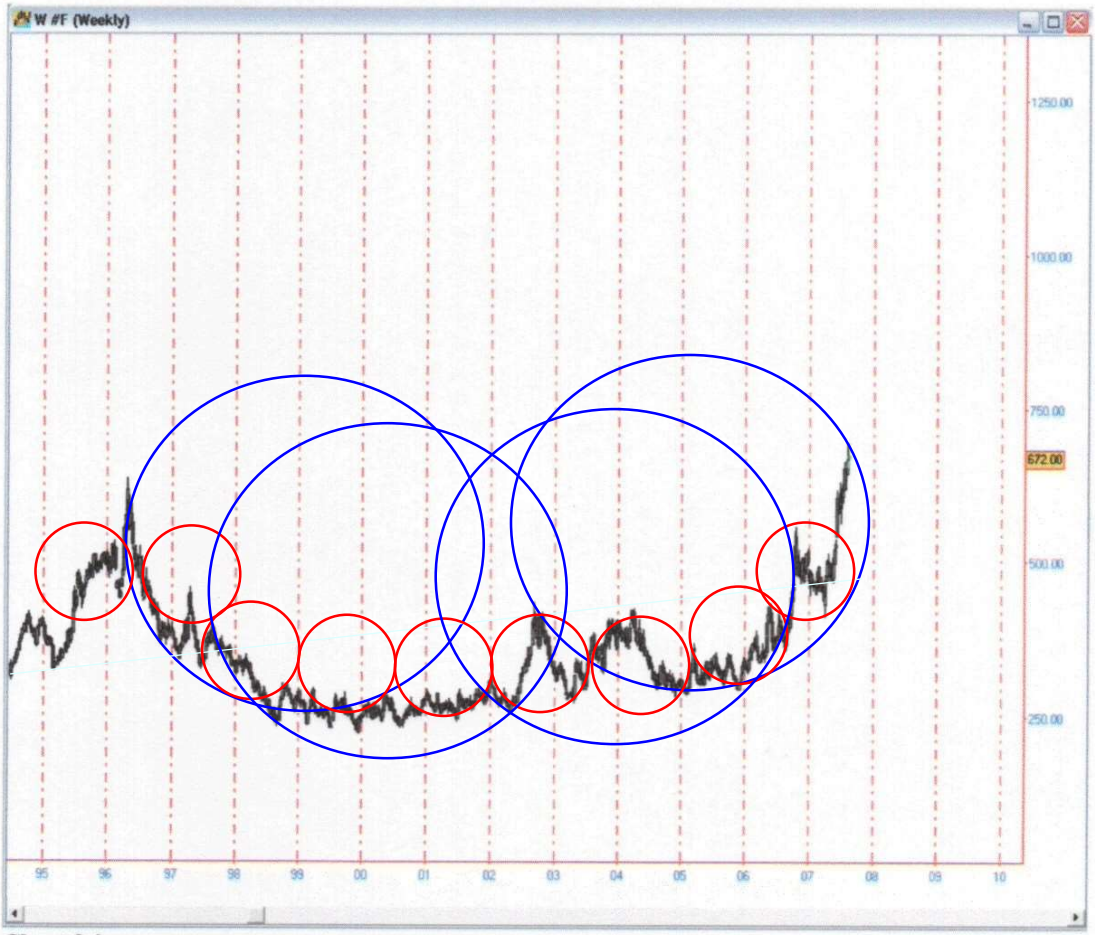

Chart 2.0

When you are satisfied with your explorations of the chart and our self then go to the next page and I will start to tell what I think.

Here is the same chart with a circle added. Look at it again and see what happens in your mind, what does it tell you and what do you want to do next?

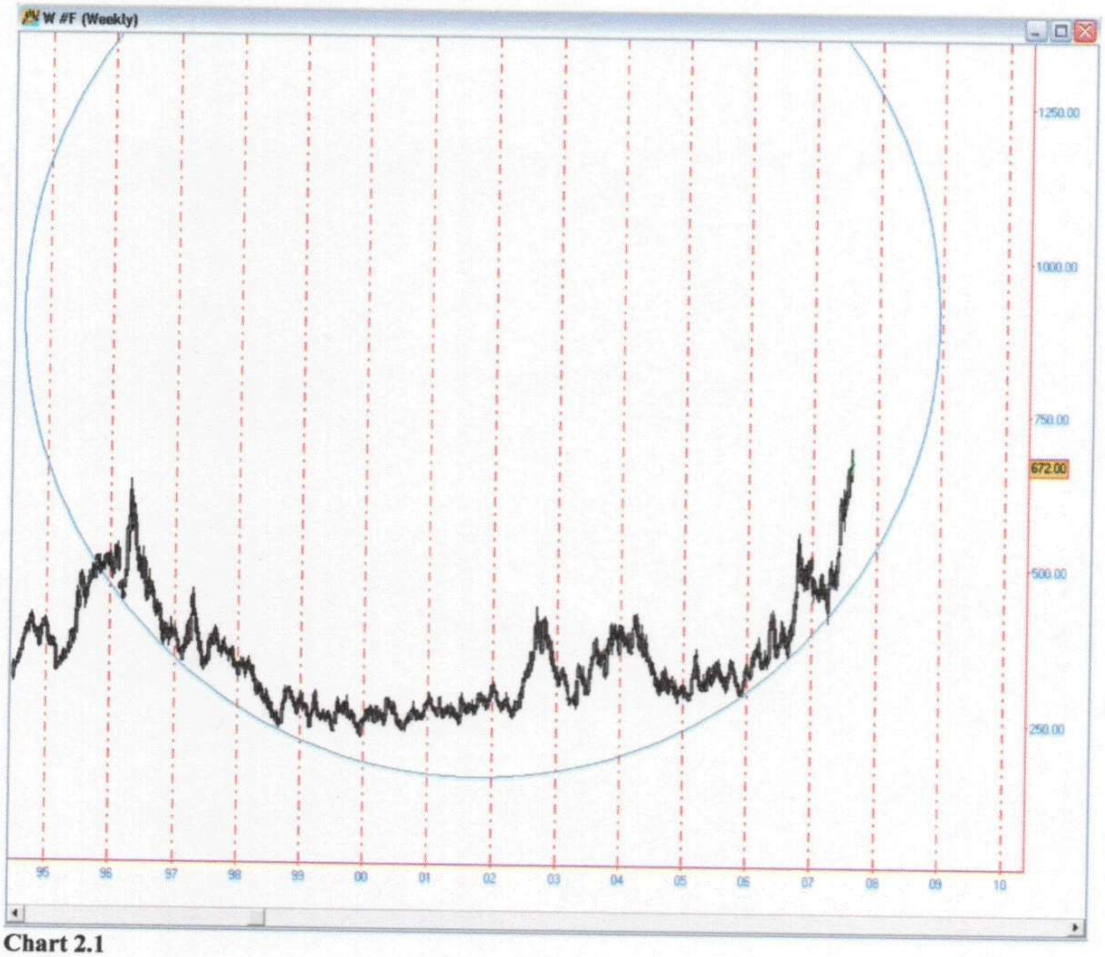

Chart 2.1

The next chart has something I saw. There are no less than 8 hits to the circumference. When something is that responsive to a perfect circle, it tells us that the chart is scaled very well to the harmonics of price/time and that we can expect other things to show up revealing the nature of the chart in relation to mathematical and geometrical similarity.

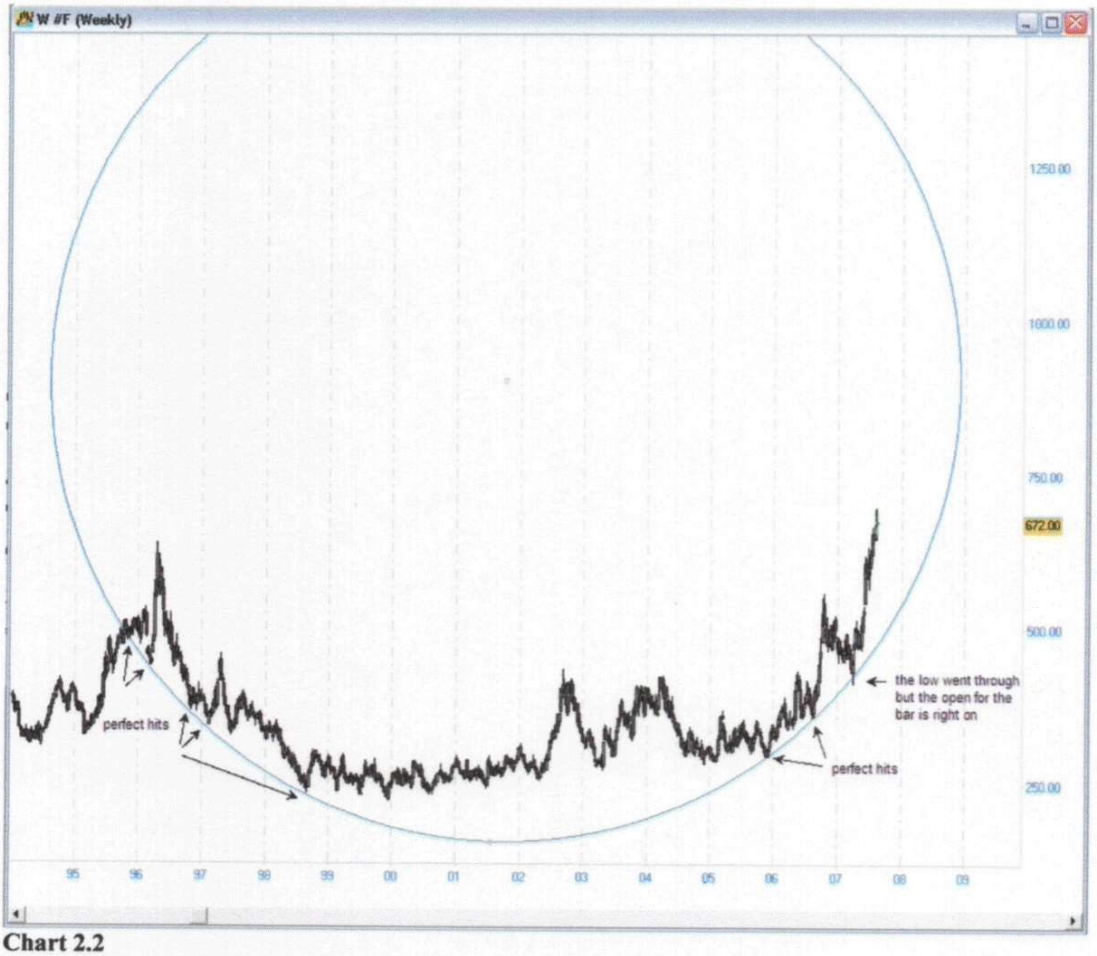

Chart 2.2

Again if you want to look some more before turning the page, take the time to do it now. When you are done, go to the next page.

Here is the same circle with three new circles added. These new circles are 1/8th intervals, or octave shells within the original circle. If we were to divide the radius of the original circle into 8 equal parts and then circumscribe new circles at these intervals we would end up with 8 inner shells of which three are illustrated below.

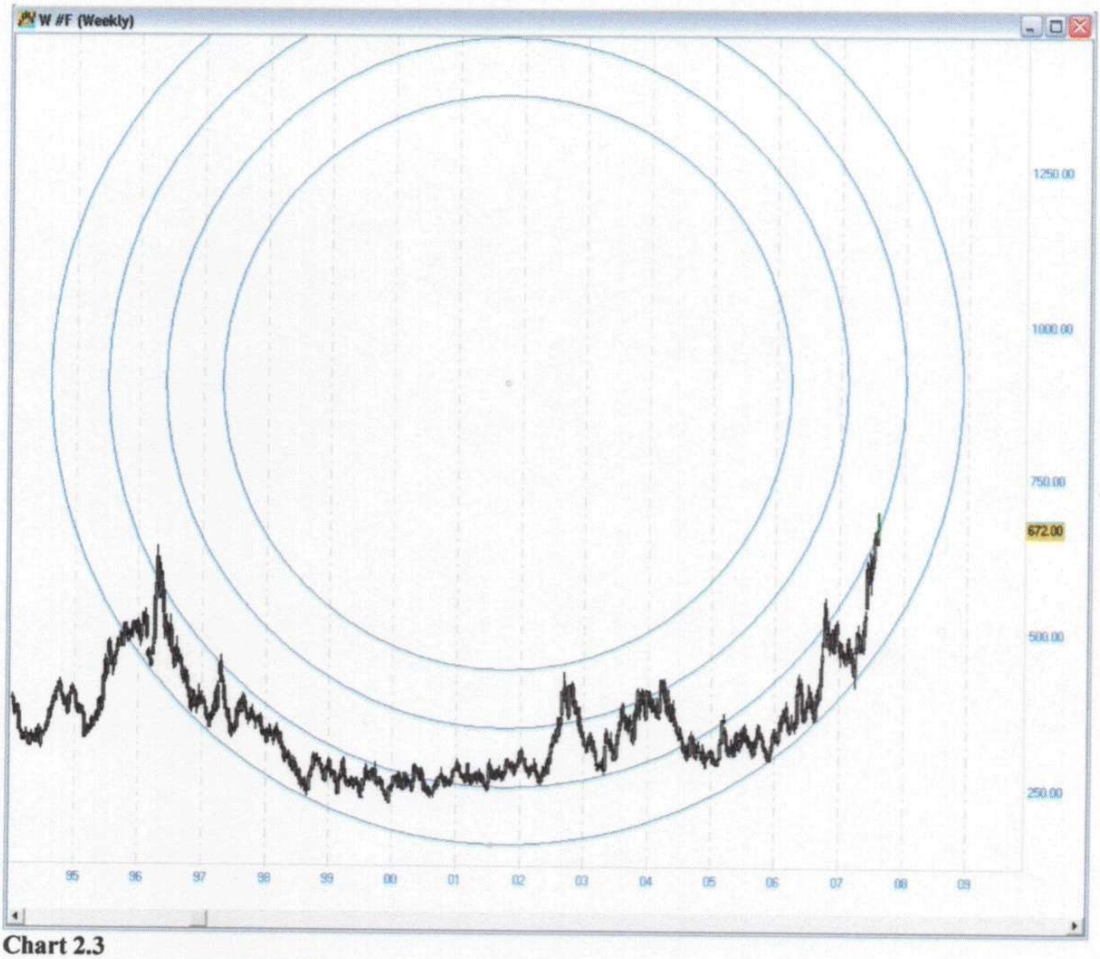

Chart 2.3

Again notice what you see with these new lines and what they may mean. Perhaps you would decide to add something to these?

On the chart below I have indicated the center of the circle, and drawn lines to the outside circle. The lines are drawn as trendlines to the price bars in most cases, to highs and lows and natural trendline slopes. Do you see a pattern or purpose to the lines?

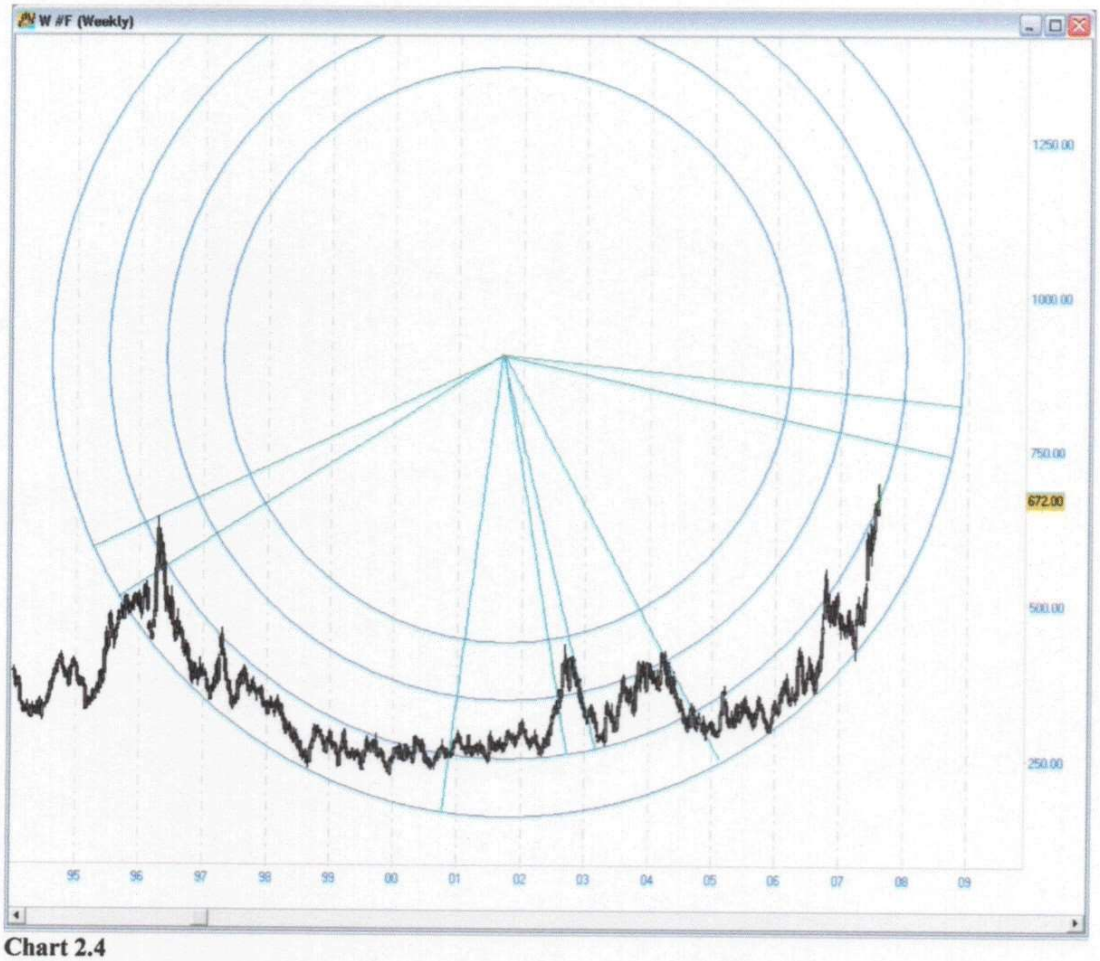

Chart 2.4

Here is a chart of the shells labeled 1.0, 7/8, 3/4, and 5/8. The three shells are color coded for each shell where price bars are in the shell. Notice that price moves in a balanced symmetry around the shells of the circles center and the high in 2002 is the apex of the symmetry as it moves into the third shell.

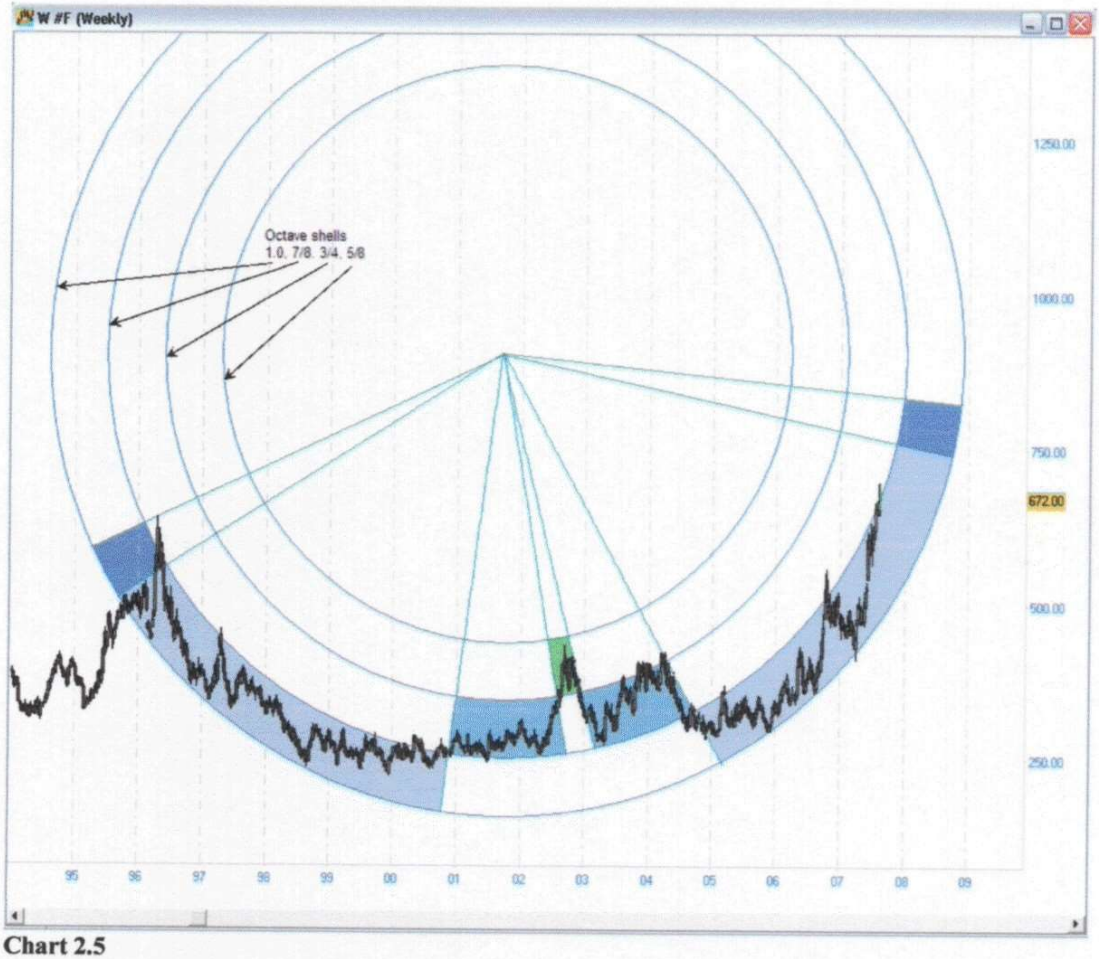

Chart 2.5

See what else you see as interesting before going on to the next page.

In this chart I have added the horizontal price line at 900. As you can see, it goes exactly through the center of the circle.

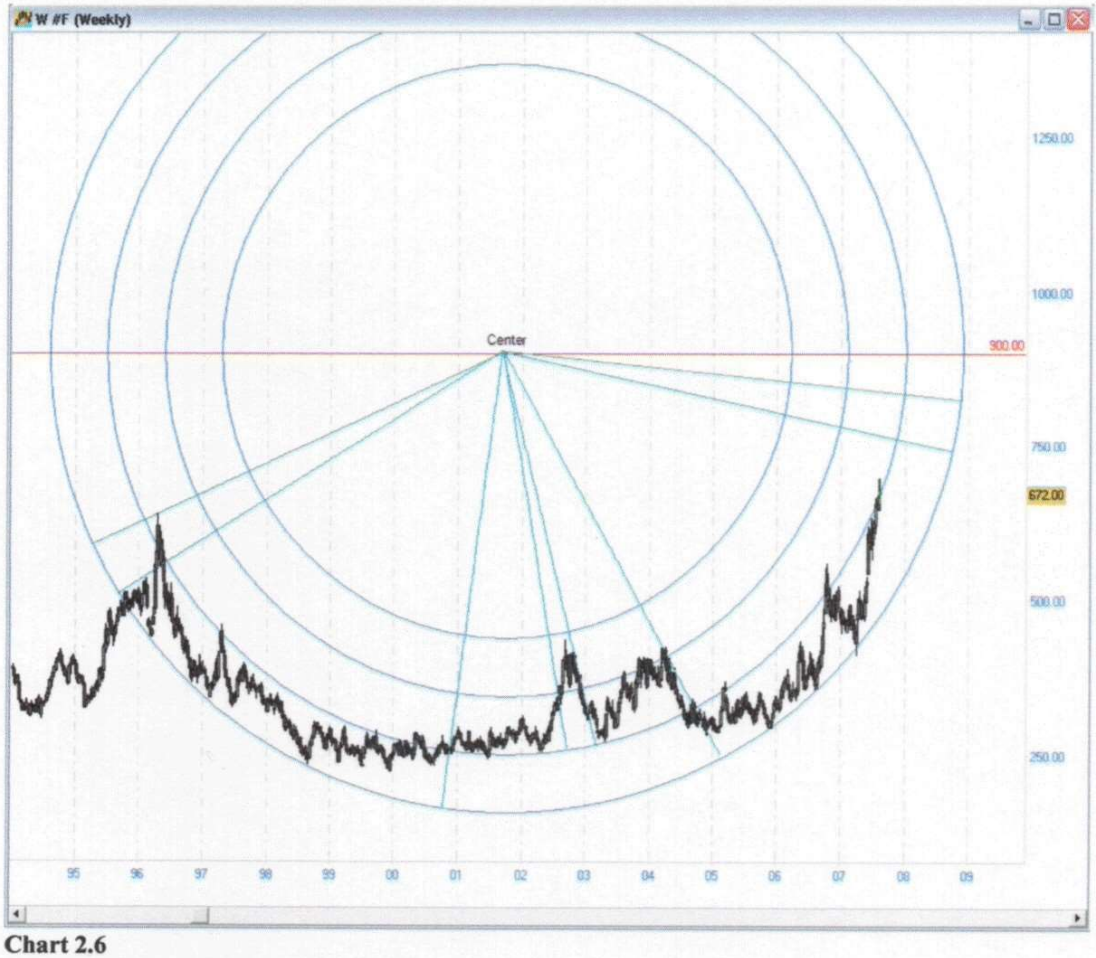

Chart 2.6

What else do you see now?

Here I have added the 450 horizontal price line and note that it hits several of the highs and lows of the price bars as they move across the chart. Also this line hits the top of the apex of the symmetry of the 2002 high.

I have also added the 162 horizontal price line, (Fibonacci ratio 161.8) and this line creates the base of the original circle for the pattern we are looking at.

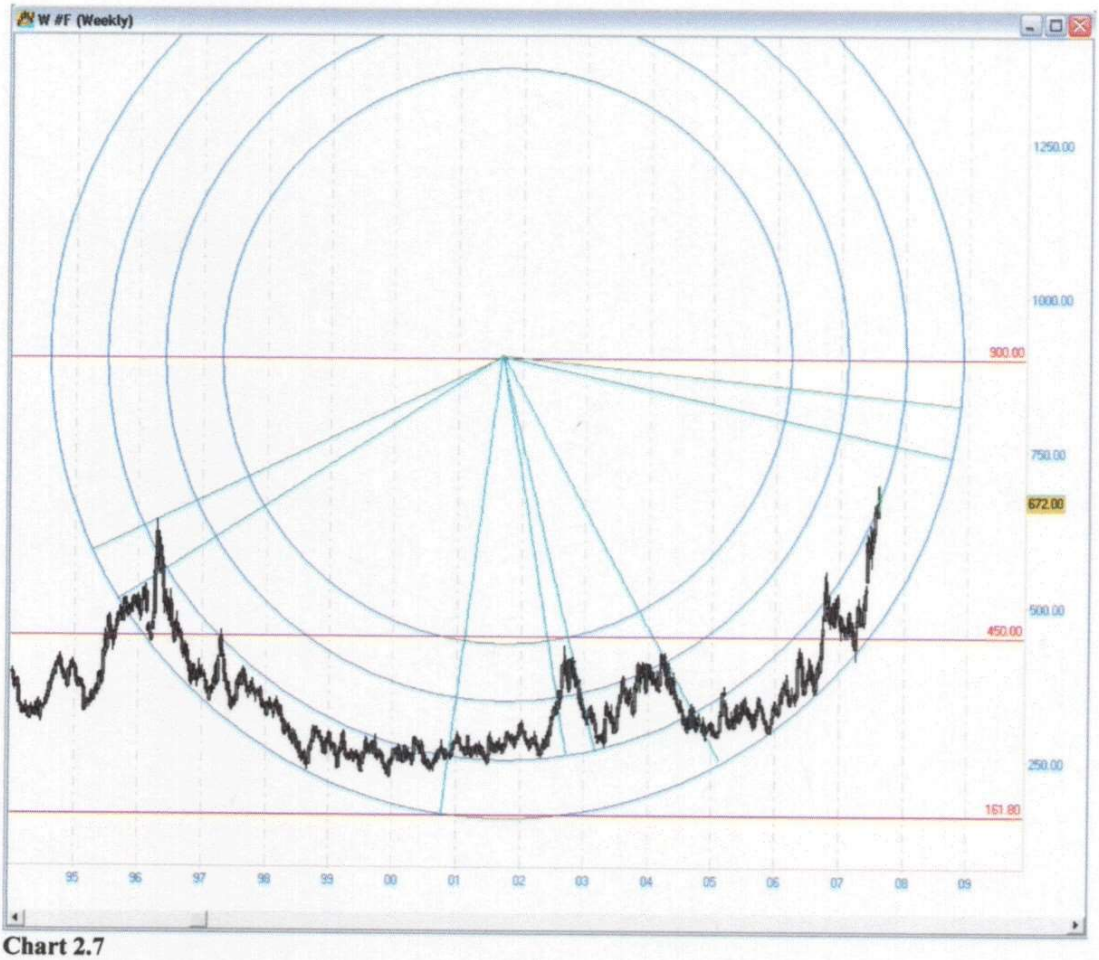

Chart 2.7

I am going to continue to add tools and lines and so before going on, decide what you would like to add. Think about what you already see, and then relax and see what else is there to be seen. There are many more than what I will put on the following charts, so it isn't about right and wrong, it is about seeing.

Here is a simple fib ratio from the bottom of the circle to the center (161.8 to 900). Notice that the apex 2002 high and many other highs and lows are at 61.8. You can see that 50 and 38.2 are similarly indicating reversal and continuation points on the price bars.

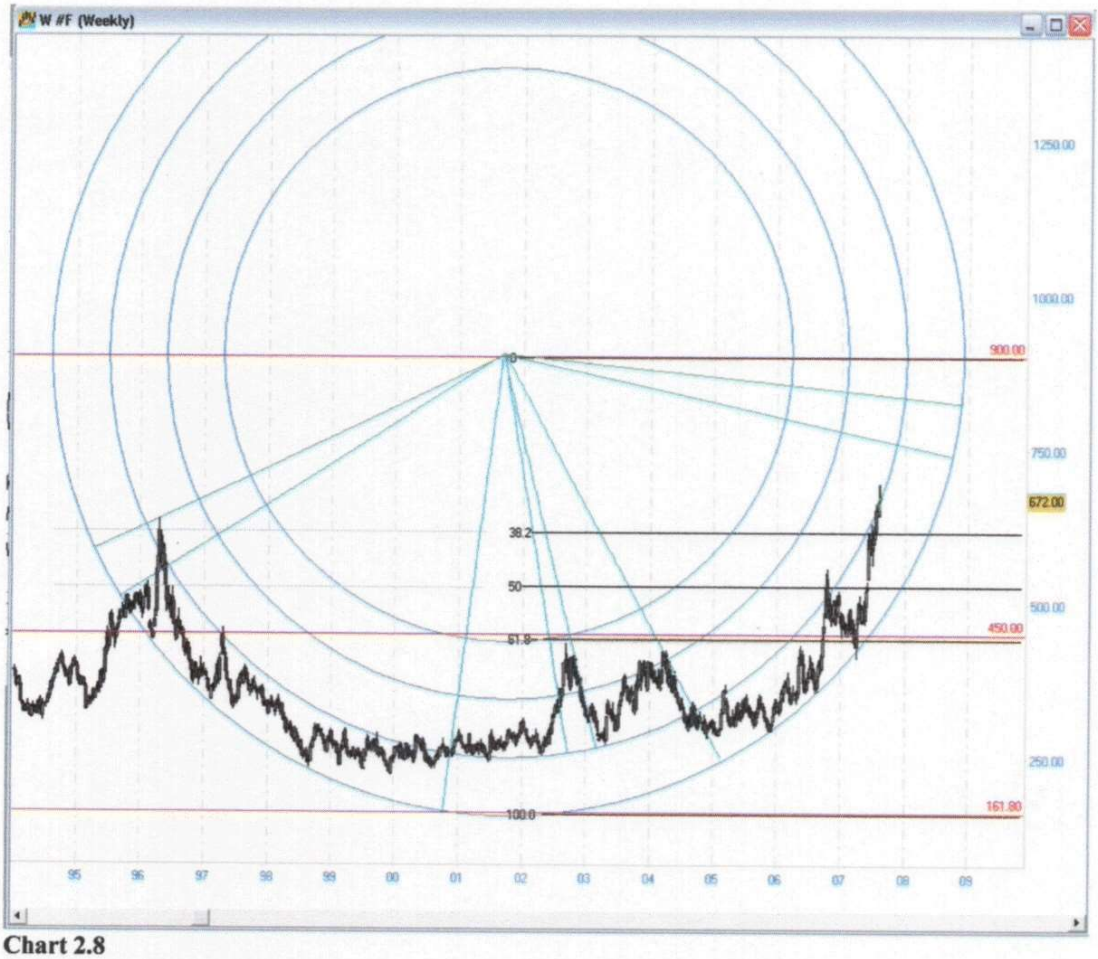

Chart 2.8

Here is another set of identical shells set to the center point on the 900 line and last exterior shell of the original set and running through the center point of the first set.

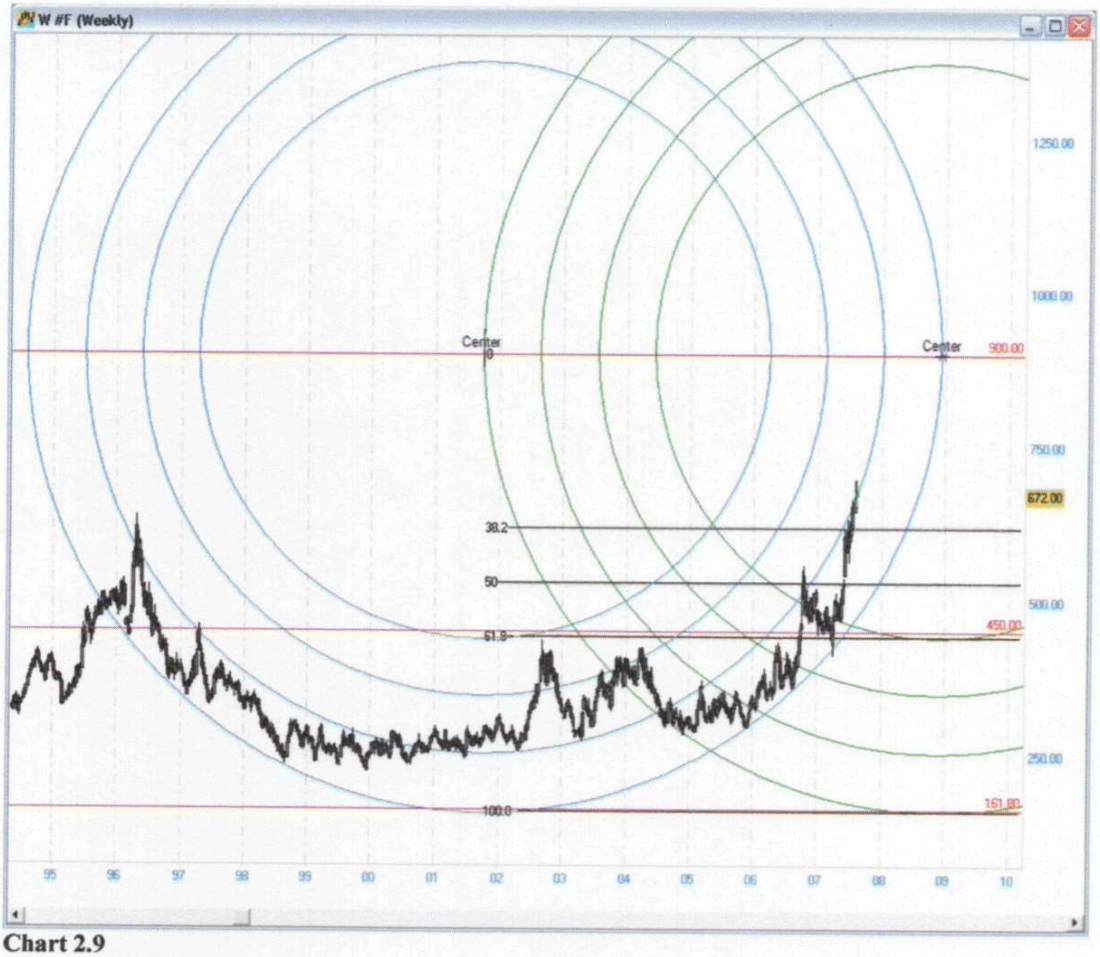

Chart 2.9

It has some interesting things happening, when you have studied it sufficiently then go on.

Here is the outer shell of the second set colored in and as we notice the price bars, we see when it entered this shell it moved down through the shells interior to the outer shell of the original set and then started back up, making hesitations at each shell layer.

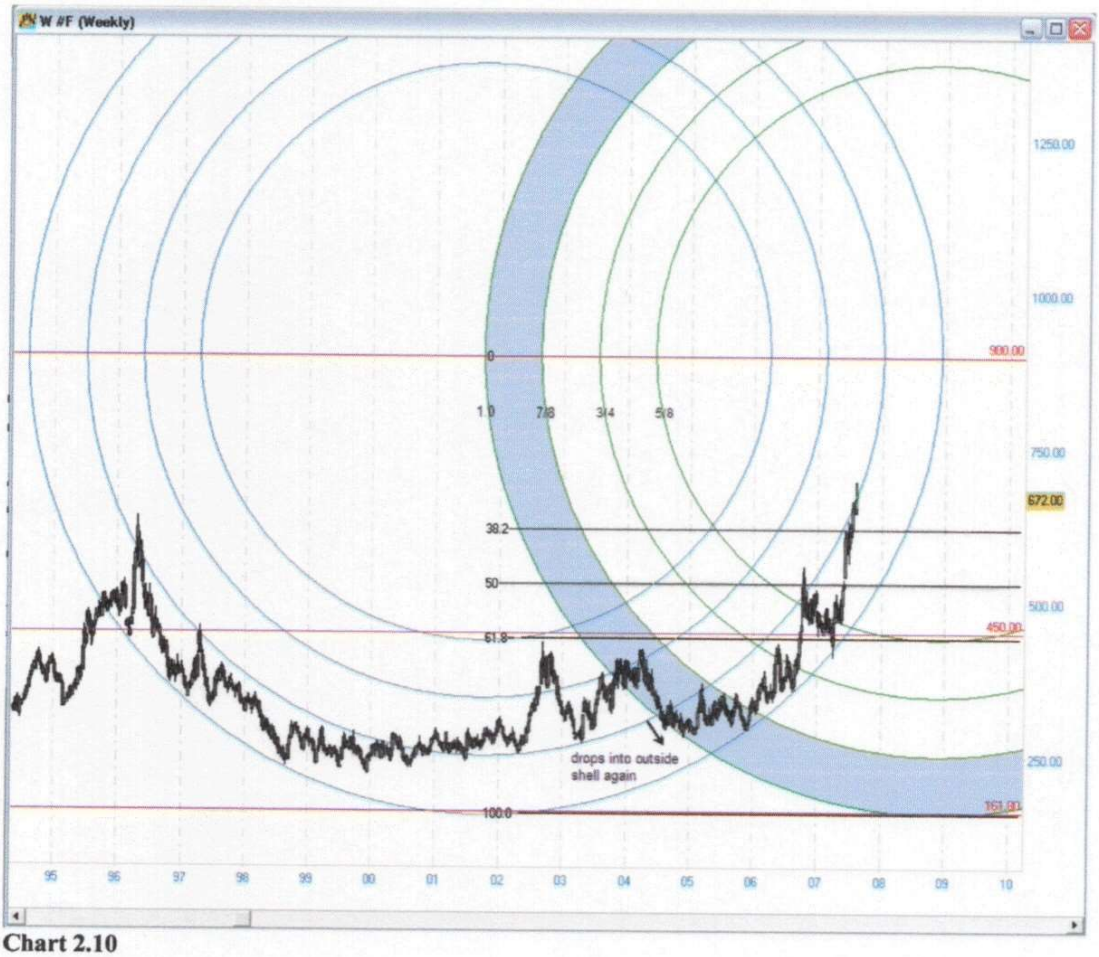

Chart 2.10

I will stop now, but you can experiment and add more to this exploration. There are many ways of seeing the balance and underlying symmetry and patterns of any market. When one way is found, there are many others too, just keep looking and they will show up.

One of the common balancing patterns we can look for is the common doubling relationship of price or time. Doubling is just a duplication of a pattern and it is happening all the time. One plus one is two and one price/time pattern plus the same price/time equivalent will equal two. This is an easy predictive tool when they are identified.

Other patterns are present also, but this simple one can be seen by noticing a 50% retracement, or a mirror image fold back, or a squared chart that is duplicating squares or rectangles in the price/time patterns. I will use a few charts I posted in the Wave59 forum as examples and you can practice finding these on nearly any chart. A squared chart will have more squares. A non squared chart may only show rectangles, but all are useful. The advantage of a squared chart is that other tools requiring a squared chart will develop a more thorough view of the underlying matrix and its harmonics.

In this first chart notice the grid is a square of nine pattern with a 32 bar square. Each movement within the individual 32 bar square has price ending and beginning at the next squares corner (lower left corner).

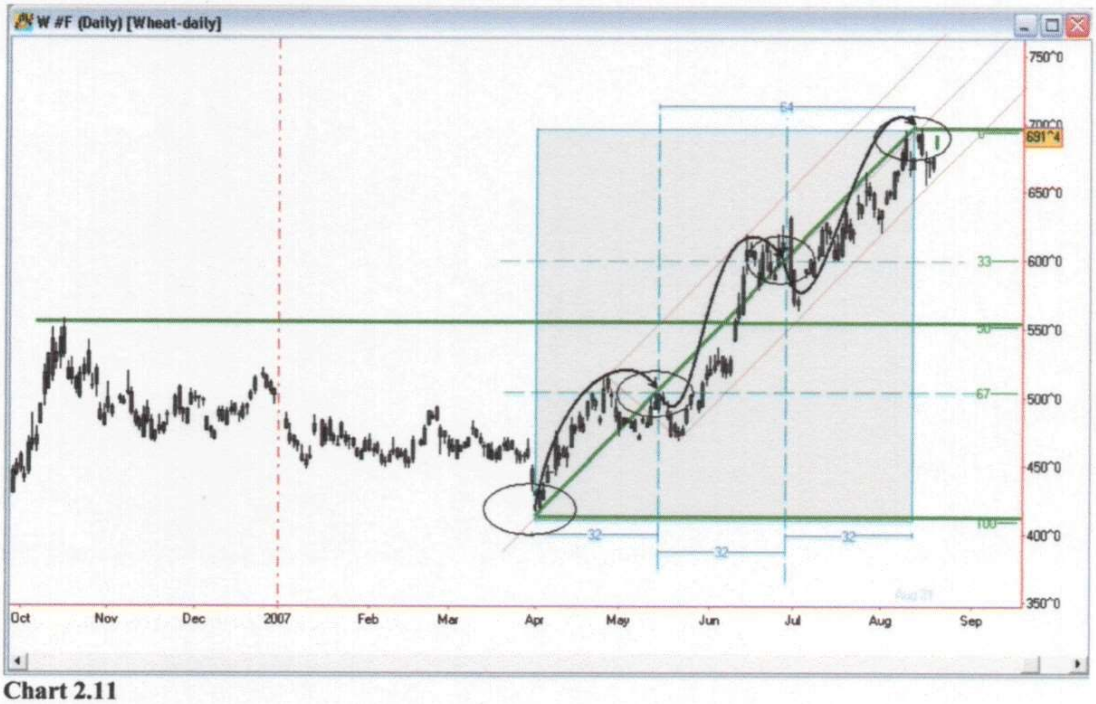

Chart 2.11

In this same chart I've added a square of four over the same price bars as the previous square of nine. Here price ends and begins at the mid point repeating a doubling of price and time. Price and time may not be equal as in the other two rectangles on the chart. Here price is less than time and so we have a flatter rectangle and not a square but the doubling ratio is the same.

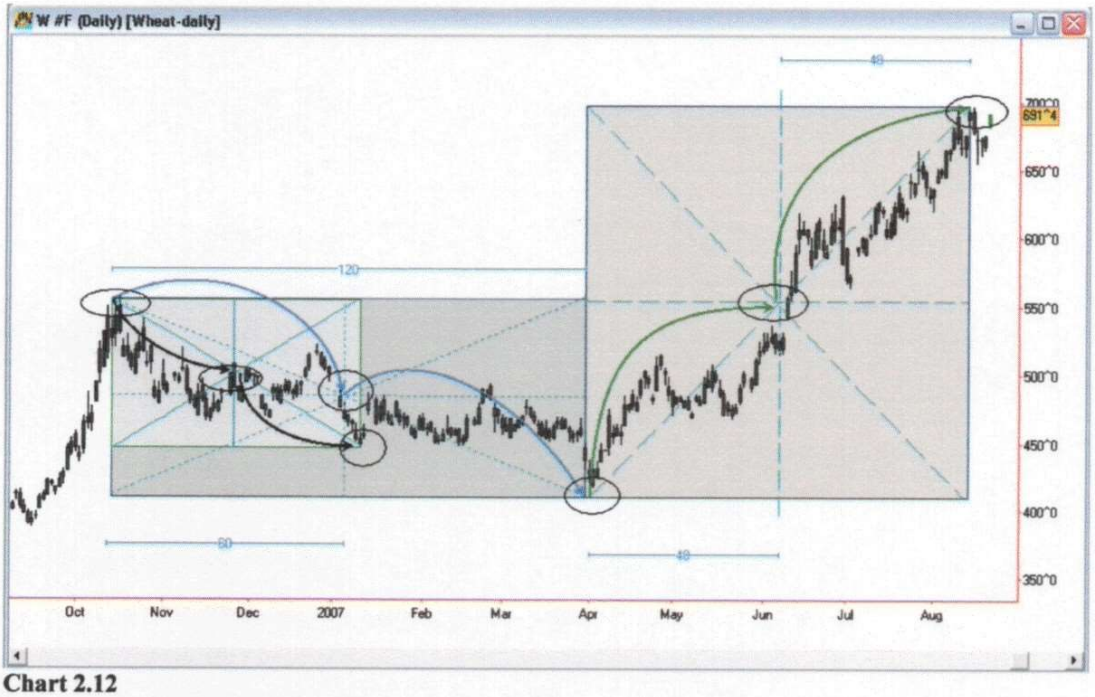

Chart 2.12

Chapter 3

W. D. Gann and the Law of Vibration

"Study the charts
And convince yourself
That what I am telling you
Is the truth"

W. D. Gann
1878 - 1955

There are many great minds from the past and present that have proposed a way of seeing how things work. We will look at four diverse men, comparing their relevancy to our viewpoint and belief system. These men have differing viewpoints and it is not intended that they will provide "the" answer one may be looking for, but these thoughts are included here to provide an opportunity to see where you may have an interest and by seeing these four who successfully found their way that you can too.

It is about your inner knowing that these external examples may add some insight too. So read these with openness to your realizing your desires, and if they aren't clear yet, then be open to seeing where you are drawn to want to know more about what you are reading and this will lead you to that which you are wanting. Some of these men may have components of your desire, so don't necessarily read all these with the idea you must believe it all. You are looking for knowledge and core beliefs that will align with your desires.

Be selective in what fits and what doesn't. This assumes you know what you desire (want). Until you know that, finding the way to get there is like getting the cart before the horse, you have to get clear about where you are going before you try to get there. So do that right now if you don't know, continuing to read will not bring the greatest benefit of what this book can offer. Knowing where you want to go makes the map have value.

So let's look at one of the reasons many traders are interested in the Law of Vibration. The man named W.D. Gann became a trading legend of sorts and one of the main reasons for his success was the understanding and application of what he called the Law of Vibration. He wrote many books and articles and published newsletters and taught many students. His books are still widely read today and the topic of many who would like to know how the man forecast and traded as well as he did.

We are going to include in this chapter part of a newspaper article written in 1909 in *The Ticker and Investment Digest*, an article about W. D. Gann and his statements of how he was able to be so successful and some history of his trading. Pay attention to what thoughts come up as you are reading, write them down (in this book would be good) so you can become aware of your process and thinking. What is Gann talking about when he describes the Law of Vibration?

>>>>>>>>>>>>>>>>>>>>>>>

THE TICKER AND INVESTMENT DIGEST

Vol. 5 No. 2

December, 1909

WILLIAM D. GANN

An Operator Whose Science and Ability Place Him in the Front Rank –His Remarkable Predictions and Trading Record.

Sometime ago the attention of this magazine was attracted by certain long pull stock market predictions which were being made by William D. Gann. In a large number of cases Mr. Gann gave us in advance the exact points at which certain stocks and commodities would sell, together with prices close to the then prevailing figures which would not be touched.

For instance, when New York Central was 131 he predicted it would sell at 145 before 129.

So repeatedly did his figures prove to be accurate, and so different did his work appear from that of any expert whose methods we have examined, that we set about to investigate Mr. Gann and his way of figuring out these predictions, as well as the particular use which he was making of them in the market.

The results of this investigation are remarkable in many ways.

It appears to be a fact that Mr. Gann has developed an entirely new idea as to the principles governing stock market movements. He bases his operations upon certain natural laws, which, though existing since the world began, have only in recent years been subjected to the will of man, and added to the list of so-called modern discoveries.

We have asked Mr. Gann for an outline of his work and have secured some remarkable evidence as to the results obtained there from. We submit this in full recognition of the fact that in Wall Street a man with a new idea – an idea which violates the traditions and encourages a scientific view of the proposition – is not usually welcomed by the majority, for the reason that he stimulates thought and research. These activities said majority abhors.

Mr. Gann's description of his experience and methods is given herewith. It should be read with a recognition of the established fact that Mr. Gann's predictions have proved correct in a large majority of instances.

"For the past ten years I have devoted my entire time and attention to the speculative markets. Like many others, I lost thousands of dollars and experienced the usual ups and downs incidental to the novice who enters the market without preparatory knowledge of the subject.

"I soon began to realize that all successful men, whether lawyers, doctors, or scientists, devoted years of time to the study and investigation of their particular pursuit or profession before attempting to make any money out of it.

"Being in the brokerage business myself and handling large accounts, I have opportunities seldom afforded the ordinary man for studying the cause of success and failure in the speculations of others. I found that over ninety per cent of the traders who go into the market without knowledge or study usually lose in the end.

"I soon began to note the periodical recurrence of the rise and fall in stocks and commodities. This led me to conclude that natural law was the basis of market movements. I then decided to devote ten years of my life to the study of natural law as applicable to the speculative markets and to devote my best energies toward making speculation a profitable profession. After exhaustive researches and investigations of the known sciences, I discovered that the Law of Vibration enabled me to accurately determine the exact points to which stocks or commodities should rise and fall within a given time. The working out of this law determines the cause and predicts the effect long before the Street is aware either. Most speculators can testify to the fact that it is looking at the effect and ignoring the cause that has produced their losses.

"It is impossible here to give an adequate idea of the Law of Vibration as I apply it to the markets, however, the layman may be able to grasp some of the principles when I state that the Law of Vibration is the fundamental law upon which wireless telegraphy, wireless telephone and phonographs are based. Without the existence of this law the above inventions would have been impossible.

"In order to test out the efficiency of my idea I have not only put in years of labor in the regular way, but I spent nine months working night and day in the Astor Library of New York and in the British Museum of London, going over the records of stock transactions as far back at 1820. I have incidentally examined the manipulations of Jay Gould, Daniel Drew, Commodore Vanderbilt, and all the other important Wall Street manipulators from that time to the present day. I have examined every quotation of Union Pacific prior to and from the time of E. H. Harriman's securing control, and can say that of all the manipulations in the history of Wall Street, Mr. Harriman's was the most masterly. The figures show that, whether unconsciously or not, Mr. Harriman worked strictly in accordance with natural law.

"In going over the history of markets and the great mass of related statistics, it soon becomes apparent that certain laws govern the changes and variations in the value of stocks and there exists periodic or cyclic law, which is at the back of all these movements. Observation has shown that there are regular periods of intense activity on the Exchange followed by periods of inactivity. Mr. Henry Hall, in his recent book devoted much space to 'Cycles of Prosperity and Depression' which he found recurring at regular intervals of time. The law which I have applied will not only give these long cycles or swings, but the daily and even hourly movements of stocks. By knowing the exact vibration of each individual stock I am able to determine at what point each will receive support and what point the greatest resistance is to be met.

"Those in close touch with the market have noticed the phenomena of ebb and flow, or rise and fall in the value of stocks. At certain times a stock will become intensely active, large transactions being made in it; at other times this same stock will become practically stationary or inactive with a very small volume of sales. I have found that the Law of Vibration governs and controls these conditions. I have also found that certain phases of this law govern the rise in a stock and an entirely different rule operates on the decline.

"While Union Pacific and other railroad stocks which made their high prices in August were declining, United States Steel common was steadily advancing. The Law of Vibration was at work, sending a particular stock on the upward trend, whilst others were trending downward.

"I have found that in the stock itself exists its harmonic or inharmonic relationship to the driving power or force behind it. The secret of all its activity is therefore apparent. By my method I can determine the vibration of each stock and by also taking certain time values into consideration I can in the majority of cases tell exactly what the stock will do under given conditions.

"The power to determine the trend of the market is due to my knowledge of the characteristics of each individual stock and a certain grouping of different stocks under their proper rates of vibration. Stocks are like electrons, atoms, and molecules, which hold persistently to their own individuality in response to the fundamental Law of Vibration. Science teaches 'that an original impulse of any kind finally resolves itself into periodic or rhythmical motion,' also 'just as the pendulum returns again in its swing, just as the moon returns in its orbit, just as the advancing year ever brings the rose of spring, so do the properties of the elements periodically recur as the weight of the atoms rises.'

"From my extensive investigations, studies and applied tests, I find that not only do the various stocks vibrate, but that the driving forces controlling the stocks are also in a state of vibration. These vibratory forces can only be known by the movements they generate on the stocks and their values in the market. Since all great swings or movements of the market are cyclic they act in accordance with the periodic law.

"Science has laid down the principle that 'the properties of an element are a periodic function of its atomic weight.' A famous scientist has stated that 'we are brought to the conviction that diversity in phenomenal nature in its different kingdoms is most intimately associated with numerical relationship. The numbers are not intermixed, chaotically and accidentally, but are subject to regular periodicity. The changes and developments are also seen to be in many cases undulatory.'

"Thus, I affirm, every class of phenomena, whether in nature or in the stock market, must be subject to the universal law of causation and harmony. Every effect must have an adequate cause.

"If we wish to avert failure in speculation we must deal with causes. Everything in existence is based on exact proportion and perfect relationship. There is no chance in nature, because mathematical principles of the highest order lie at the foundation of all things. Faraday said: 'There is nothing in the Universe but mathematical points of force.'

"Vibration is fundamental; nothing is exempt from this law; it is universal, therefore applicable to every class of phenomena on the globe."

"Through the Law of Vibration every stock in the market moves in its own distinctive sphere of activities, as to intensity, volume and direction; all the essential qualities of its evolution are characterized in its own rate of vibration. Stocks, like atoms, are really centers of energies, therefore they are controlled mathematically. Stocks create their own field of action and power; power to attract and repel, which principle explains why certain stocks at times lead the market and 'turn dead' at other times. Thus to speculate scientifically it is absolutely necessary to follow natural law.

"After years of patient study I have proven to my entire satisfaction as well as demonstrated to others that vibration explains every possible phase and condition of the market."

In order to substantiate Mr. Gann's claims as to what he has been able to do under this method, we called upon Mr. William E. Gilley, an Inspector of Imports, 16 Beaver street, New York. Mr. Gilley is well-known in the down-town district. He himself has studied stock market movements for twenty-five years, during which time he has examined every piece of market literature that has been issued and procurable in Wall Street. It was he who encouraged Mr. Gann to study out the scientific and mathematical possibilities of the subject. When asked what had been the most impressive of Mr. Gann's work and predictions, he replied as follows:

"It is very difficult for me to remember all the predictions and operations of Mr. Gann which may be classed as phenomenal, but the following are a few: In 1908 when Union Pacific was 168 1/8 he told me that it would not touch 169 before it had a good break. We sold it short all the way down to 152 5/8, covering on the weak spots and putting it out again on the rallies, securing twenty-three points profit out of an eighteen-point move.

"He came to me when United States Steel was selling around 50 and said 'This Steel will run up to 58 but it will not sell at 59. From there it should break 16 ¾ points. We sold it short at 58 3/8 with a stop at 59. The highest it went was 58 ¾. From there it declined to 41 ¼ – 17 ½ points.

"At another time wheat was selling at about 89c. He predicted that the May option would sell at $1.35. We bought it and made large profits on the way up. It actually touched $1.35 ½.

"When Union Pacific was 172, he said it would go to 184 7/8 but not an eighth higher until it had had a good break. It went to 184 7/8 and came back from there eight or nine times. We sold it short repeatedly with a stop at 185 and were never caught. It eventually came back to 172 ½.

"Mr. Gann's calculations are based on natural law. I have followed his work closely for years. I know that he has a firm grasp of the basic principles which govern the stock market movements, and I do not believe any other man on earth can duplicate the idea or his method at the present time.

"Early this year he figured that the top of the advance would fall on a certain day in August and calculated the prices at which the Dow Jones Averages would then stand. The market culminated on the exact day and within four-tenths of one per cent. Of the figures predicted."

"You and Mr. Gann must have cleaned up considerable money on all these operations," was suggested.

"Yes, we have made a great deal of money. He has taken half a million dollars out of the market in the past few years. I once saw him take $130, and in less than one month run it up to cover $12,000. He can compound money faster than any man I ever met."

"One of the most astonishing calculations made by Mr. Gann was during last summer (1909) when he predicted that September wheat would sell at $1.20. This meant that it must touch that figure before the end of the month of September. At twelve o'clock, Chicago time, on September 30th (the last day) the option was selling below $1.08, and it looked as though his prediction would not be fulfilled. Mr. Gann said 'If it does not touch $1.20 by the close of the market it will prove that there is something wrong with my whole method of calculation. I do not care what the price is now, it must go there.' It is common history that September wheat surprised the whole country by selling at $1.20 and no higher in the very last hour of trading, closing at that figure.

So much for what Mr. Gann has said and done as evidenced by him and others. Now as to what demonstrations have taken place before our representative:

During the month of October, 1909, in twenty-five market days, Mr. Gann made, in the presence of our representative, two hundred and eighty-six transactions in various stocks, on both the long and short side of the market. Two hundred and sixty-four of these transactions resulted in profits; twenty-two in losses.

The capital with which he operated was doubled ten times, so that at the end of the month he had one thousand per cent. On his original margin.

In our presence, Mr. Gann sold Steel common short at 94 7/8, saying that it would not go to 95. It did not.

On a drive which occurred during the week ending October 29th, Mr. Gann bought Steel common at 86 ¼, saying that it would not go to 86. The lowest it sold was 86 1/8.

We have seen him give in one day sixteen successive orders in the same stock, eight of which turned out to be either the top or the bottom eighth of that particular swing. The above we can positively verify.

Such performances as these, coupled with the foregoing, are probably unparalleled in the history of the Street.

James R. Keene has said, "The man who is right six times out of ten will make his fortune." Here is a trader, who, without any attempts to make a showing (for he did not know the results were to be published), established a record of over ninety-two per cent profitable trades.

Mr. Gann has refused to disclose his method at any price, but to those scientifically inclined he has unquestionably added to the stock of Wall Street knowledge and pointed out infinite possibilities.

We have requested Mr. Gann to figure out for the readers of The Ticker a few of the most striking indications which appear in his calculations. In presenting these we wish it understood that no man, in or out of Wall Street, is infallible.

Mr. Gann's figures at present indicate that the trend of the stock market should, barring the usual rallies, be toward lower prices until March or April, 1910.

He calculates that May wheat, which is now selling at $1.02, should not sell below 99c and should sell at $1.45 next spring.

On cotton, which is now at about the 15c level, he estimates that, after a good reaction from these prices, the commodity should reach 18c in the spring of 1910. He looks for a corner in the March or May option.

Whether these figures prove correct or not, will in no sense detract from the record which Mr. Gann has already established.

Mr. Gann was born in Lufkin, Texas, and is thirty-one years of age. He is a gifted mathematician, has an extraordinary memory for figures, and is an expert Tape Reader. Take away his science and he would beat the market on his intuitive tape reading alone.

Endowed as he is with such qualities, we have no hesitation in predicting that within a comparatively few years Wm. D. Gann will receive full recognition as one of Wall Street's leading operators.

R. D. W.

Note – Since the above forecast was made, Cotton has suffered the expected decline, the extreme break having been 120 points. The lowest on May wheat thus far has been $1.01 5/8. It is now selling at $1.06 ¼.

>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Before reading this next section on my thoughts about Gann's message, I would suggest, if you have the desire, go back to the beginning of the article and write down your own thoughts that come to you on the second reading. You will see different possibilities than I do because you have a unique set of background information, different than mine, and it will produce a new interpretation. If you read what I have written first, then you will cloud your own view with my bias. You are looking for what you want, not necessarily what I want and so look first at your ideas and then look at mine. You have plenty of time, no need to rush through this book, you are the one learning here, give yourself all the time you need.

If you are satisfied with your second reading (or third, fourth…) and have made written notes to remind you of what you discovered, then lets proceed and see if anything I say will add to what you are looking for. By the way, do you know what you are looking for? Have you a clear question or statement of what it is that is worth all this time spent reading and studying? If you can write down a clear question you can find a clear answer, but most of us have very vague ideas of what we really want and so we can only find vague fulfillment for the journey.

There are many who have commented on this Ticker Digest article and many ways to approach it. One way is to search for hidden meaning in what is written, as Gann was one who alluded to the fact in his Tunnel Thru the Air that more was there than just information gained from a cursory reading. He hid information, much like the esoteric works he had studied and how they had required the reader to put forth considerable effort to gain the fullest benefit from it.

Whether Gann intentionally put more information "between the lines so to speak" in this article, will be up to the reader to decide. But remember that what additional information one finds is coming from within the knowledge base of the reader not from Gann. What you see is what you get from Gann, what more you see is from you.

It is from your particular understanding that you add this additional information and the result is a new perspective.

Like mixing ingredients to make a cake, if you start with different initial ingredients in the bowl than someone else (like we all have different data bases in our head) then by adding the secret ingredient that Gann provides (say it is yeast) then our cakes when they come out of the oven may be very different. Similarly, by adding new information into our bowl heads each of us will have a different result come out of the contemplating oven. This is one of the reasons Gann requested his students to read a list of books prior to studying with him; he knew they needed a similar matrix in their mind to produce the same perspective he was trying to give them.

Having said all this, are we clear where we want to go? Have you explored enough on your own? If so, then let's start looking again at what Gann may be saying, and in this we may find what we are saying. The first part of the article appears to be written by the author of the article. The reason I say appears to be written by is because what we are seeing today in this moment are some words written apparently 100 years ago and we weren't there. It is possible Gann wrote the whole thing, or someone else wrote the whole thing and used Gann's name or whatever scenario we decide we want to believe. We really don't know but choose to see it in a way that supports what we are looking for. So again it is important to know what we are looking for because we will find it.

Let's go to the quotation marks that indicate Gann speaking and focus our attention on what he is saying. The rest of the article is the author substantiating Gann's authenticity and that isn't as relevant to us as what Gann may have said "how" he did it.

The first Gann quotation marks start with:

"For the past ten years I have devoted my entire time and attention to the speculative markets. Like many others, I lost thousands of dollars and experienced the usual ups and downs incidental to the novice who enters the market without preparatory knowledge of the subject.

"I soon began to realize that all successful men, whether lawyers, doctors, or scientists, devoted years of time to the study and investigation of their particular pursuit or profession before attempting to make any money out of it.

"Being in the brokerage business myself and handling large accounts, I have opportunities seldom afforded the ordinary man for studying the cause of success and failure in the speculations of others. I found that over ninety per cent of the traders who go into the market without knowledge or study usually lose in the end."

Here Gann tells us a few things about himself. He sees it is necessary to spend considerable time in learning knowledge of a subject and that people who do are successful and people who don't aren't. Remember we are hearing Gann's way, and that mine or yours may be different (unless we blindly follow someone else and fail to see our own way). Gann goes on:

"I soon began to note the periodical recurrence of the rise and fall in stocks and commodities. This led me to conclude that natural law was the basis of market movements. I then decided to devote ten years of my life to the study of natural law as applicable to the speculative markets and to devote my best energies toward making speculation a profitable profession. After exhaustive researches and investigations of the known sciences, I discovered that the Law of Vibration enabled me to accurately determine the exact points to which stocks or commodities should rise and fall within a given time. The working out of this law determines the cause and predicts the effect long before the Street is aware either. Most speculators can testify to the fact that it is looking at the effect and ignoring the cause that has produced their losses.

Here he begins talking about natural law and periodical recurrence and after the study of this he discovers the Law of Vibration. Then he mentions that "the working out of this law determines the "cause" and predicts the effect. He then clarifies a fact, that "cause" is much more productive in being successful than "effect".

"It is impossible here to give an adequate idea of the Law of Vibration as I apply it to the markets, however, the layman may be able to grasp some of the principles when I state that the Law of Vibration is the fundamental law upon which wireless telegraphy, wireless telephone and phonographs are based. Without the existence of this law the above inventions would have been impossible.

Ok he is not going to tell us all he knows but points us in a direction of seeing how wireless technology works. Not wires but wireless, through the air…(didn't he write about a Tunnel Thru the Air?) So this law allows communication through the air, allows something to move from here to there without supporting physical structures as in wires. This is where we would have to know what Gann knew about wireless and his using this example to describe how the Law of Vibration makes it possible. Let's just let all this stuff percolate in our minds and see what comes out in a little while.

"In order to test out the efficiency of my idea I have not only put in years of labor in the regular way, but I spent nine months working night and day in the Astor Library of New York and in the British Museum of London, going over the records of stock transactions as far back as 1820. I have incidentally examined the manipulations of Jay Gould, Daniel Drew, Commodore Vanderbilt, and all the other important Wall Street manipulators from that time to the present day. I have examined every

quotation of Union Pacific prior to and from the time of E. H. Harriman's securing control, and can say that of all the manipulations in the history of Wall Street, Mr. Harriman's was the most masterly. The figures show that, whether unconsciously or not, Mr. Harriman worked strictly in accordance with natural law.

He again reminds us he is a workaholic, this is just his way and his nature so be aware of it and not necessarily take it on as ours (if it isn't). Look first within, then out and see clearly from your own eyes not others. He mentions Mr. Harriman's masterly manipulations of the market could have been conscious or unconscious but that it worked in strict accordance with natural law.

"In going over the history of markets and the great mass of related statistics, it soon becomes apparent that certain laws govern the changes and variations in the value of stocks and there exists periodic or cyclic law, which is at the back of all these movements. Observation has shown that there are regular periods of intense activity on the Exchange followed by periods of inactivity. Mr. Henry Hall, in his recent book devoted much space to 'Cycles of Prosperity and Depression' which he found recurring at regular intervals of time. The law which I have applied will not only give these long cycles or swings, but the daily and even hourly movements of stocks. By knowing the exact vibration of each individual stock I am able to determine at what point each will receive support and what point the greatest resistance is to be met.

He found there are certain laws and he calls them periodic and cyclic (and these are at the back of all movements, or another way of saying this may be these are the hidden reasons for the movements. So we should pay attention here. Knowing the vibration of the stock will allow one to determine support and resistance levels. So far he tells us this Law of Vibration is the reason wireless can work, and wireless is through the air. So far he doesn't want to tell us much more, so this through the air may be important. What is so amazing about something through the air? Ok, well keep an open mind; otherwise we will fill in the blanks with what we think from our background and not Gann's'. What Gann is telling us is coming from what he sees and knows, and for us to know that, we must see it the same way. Right now we may not, so staying available to it is better than saying we know and seeing something else. Patience is the doorway to what else is coming.

"Those in close touch with the market have noticed the phenomena of ebb and flow, or rise and fall in the value of stocks. At certain times a stock will become intensely active, large transactions being made in it; at other times this same stock will become practically stationary or inactive with a very small volume of sales. I have found that the Law of Vibration governs and controls these conditions. I have also found that certain phases of this law govern the rise in a stock and an entirely different rule operates on the decline.

In the definitions of vibration *(*see Chapter 10, The Creation Cycle of Vibration)*, one was "ebb and flow". So Gann gives us another clue, "ebb and flow" is in the

market or "rise and fall" is the same thing. Vibration is the rise and fall of the market. This is different than the "through the air stuff" perhaps. It is the physical display of the up and down of the market which is "price". Then Gann goes on to say there are "times" of great action and "times" of small action and the Law of Vibration governs these. So the Law is a controlling factor of time and price in the market.

Then he goes a little farther in stating that this controlling or governing of price and time has a different rule for up movement than for down movement in price. He alludes to specific parts of the law being responsible for one direction and maybe not the other. So the cyclic nature is not necessarily symmetrical from some perspectives.
.

"While Union Pacific and other railroad stocks which made their high prices in August were declining, United States Steel common was steadily advancing. The Law of Vibration was at work, sending a particular stock on the upward trend, whilst others were trending downward.

"I have found that in the stock itself exists its harmonic or inharmonic relationship to the driving power or force behind it. The secret of all its activity is therefore apparent. By my method I can determine the vibration of each stock and by also taking certain time values into consideration I can in the majority of cases tell exactly what the stock will do under given conditions.

Then we see he talks about different things having different interactions with the Law, so perhaps what is in one stock is different than what is in another and they will manifest differently. The vibration of a stock is different than the vibration of another and each will be affected uniquely through this Law of Vibration. He very clearly states that he has found something within a stock "itself" that is in harmonic or inharmonic relationship to an external power of force. This external force is the driving power behind the stock and that this is the secret to all its activity; that when two things are in harmony/disharmony (the stock and the driving external force) that it is indicative of its actions. He suggests it is possible to determine the vibration of the stock and that this can be applied in a manner to knowing what will happen, in accordance with certain existing conditions.

"The power to determine the trend of the market is due to my knowledge of the characteristics of each individual stock and a certain grouping of different stocks under their proper rates of vibration. Stocks are like electrons, atoms, and molecules, which hold persistently to their own individuality in response to the fundamental Law of Vibration. Science teaches 'that an original impulse of any kind finally resolves itself into periodic or rhythmical motion,' also 'just as the pendulum returns again in its swing, just as the moon returns in its orbit, just as the advancing year ever brings the rose of spring, so do the properties of the elements periodically recur as the weight of the atoms rises.'

Now we get another clue that stocks are like electrons, atoms and molecules that are uniquely individualistic, different from each other and having a unique response to the Law of Vibration. Then we are given two quotes from science:

1) "that an original impulse of any kind resolves itself into periodic or rhythmical motion" (*see Chapter 3, Secrets of Forecasting Using Wave59 Tools, Book 1*) and

2) "just as the pendulum returns again in its swing, just as the moon returns in its orbit, just as the advancing year ever brings the rose of spring, so do the properties of the elements periodically recur as the weight of the atoms rise".

These two statements are worth spending some time with to understand what Gann is saying. It is for you to open your mind to what you are looking for, Gann gives some interesting nuggets to ponder and play with, or discard and move on to what is of more interest. You will know, and if it is yes, don't pass it by, all these doors lead to the same place, but we have to open them, we have to go through and see what is there and how it fits into our Universe.

"From my extensive investigations, studies and applied tests, I find that not only do the various stocks vibrate, but that the driving forces controlling the stocks are also in a state of vibration. These vibratory forces can only be known by the movements they generate on the stocks and their values in the market. Since all great swings or movements of the market are cyclic they act in accordance with the periodic law.

As he would advise by his repeated statement of extensive investigations, studies and applied tests, spend some time with this stuff. The atoms periodic movement as represented in the Periodic Table of Elements produces the natural elements that make up our physical reality and they are identified by and regulated by this Law of Vibration, which is in itself a vibration. Therefore everything is vibration and our understanding of its workings will reveal what is the basis and understanding of what is happening. We are presented with the building blocks of our Universe as a means of understanding vibration, and everything we may want to know will come from this understanding. It seems Gann thinks this is kind of important, what do you think?

"Science has laid down the principle that 'the properties of an element are a periodic function of its atomic weight.' A famous scientist has stated that 'we are brought to the conviction that diversity in phenomenal nature in its different kingdoms is most intimately associated with numerical relationship. The numbers are not intermixed, chaotically and accidentally, but are subject to regular periodicity. The changes and developments are also seen to be in many cases undulatory.'

Now Gann gives us another quote: "we are brought to the conviction that diversity in phenomenal nature in its different kingdoms is most intimately associated with numerical relationship. The numbers are not intermixed, chaotically and accidentally, but are subject to regular periodicity. The changes and developments are also seen to

be in many cases undulatory." This statement is loaded with many ideas and a closer look will probably be worth our time.

First we hear of a numerical relationship, that numbers somehow have an important part of this hidden message we are looking for. That these numbers are not intermixed, chaotically and accidentally but are regular and held to periodicity, that they are not unrelated or separate but intimately a finite part of this whole we are looking for. (This view of numbers may be from Gann's understanding of the Pythagorean notion that everything is number.) So we can infer that the Law of Vibration is also defined as/by number or numbers. Then we hear that the changes and developments (something happening) in many cases are undulatory. Gann's choice of word here is suggesting again that this periodic movement, this ebb and flow, up and down, is like a wave on the water perhaps, or more in connection with the wireless clue he gave earlier it is like the undulating wave of energy that moves through the air in the form of electromagnetic waves perhaps, or sound waves or light waves.

"Thus, I affirm, every class of phenomena, whether in nature or in the stock market, must be subject to the universal law of causation and harmony. Every effect must have an adequate cause.

Gann uses a more strong statement, he affirms, that the stock market is subject to cause and effect, but more specifically to a law of causation and harmony. Adding harmony to this law of causation brings us back to the recognition that this process of causation is orderly, balanced and not chaotic or random but mathematically stable and in terms of numbers would be knowable and sustainable or renewable in some orderly fashion. This is important to see, that all this stuff we are looking at is very predictable and we can predict if we are aware of it.

"If we wish to avert failure in speculation we must deal with causes. Everything in existence is based on exact proportion and perfect relationship. There is no chance in nature, because mathematical principles of the highest order lie at the foundation of all things. Faraday said: 'There is nothing in the Universe but mathematical points of force.'

Now he emphasizes the nature of the Universe and more specifically the Law of Vibration is not subject to chance but is in exact proportion and relationship. In fact, it is based in mathematical principle, in numbers. That everything is but mathematical points of force or another way of saying it may be everything is a number. If this is so, then it is easy to see how everything is unique and has a different number or else it must be the same. Knowing the vibration or number of something gives us the presence of believing it is predictable, and not random or chaotic.

"Vibration is fundamental; nothing is exempt from this law; it is universal, therefore applicable to every class of phenomena on the globe."

It is everything, no exceptions, everything and so everything is available and possible because of this. Everything includes me and you too. We are a function of the Law and so are predictable in a similar fashion. We are joining in harmony or disharmony with markets and everything else in the Universe through this law.

"Through the Law of Vibration every stock in the market moves in its own distinctive sphere of activities, as to intensity, volume and direction; all the essential qualities of its evolution are characterized in its own rate of vibration. Stocks, like atoms, are really centers of energies, therefore they are controlled mathematically. Stocks create their own field of action and power; power to attract and repel, which principle explains why certain stocks at times lead the market and 'turn dead' at other times. Thus to speculate scientifically it is absolutely necessary to follow natural law.

Knowing that a stock, commodity, index, currency or any market is unique and knowable and possesses its own sphere of activities allows one to know how to predict it, as sure as 1 + 1 = 2, the vibration of the thing we are looking to predict will add up just as simply.

Then Gann uses a word we may want to pay attention to. He mentions "all the essential qualities of its **evolution** are characterized in its own rate of vibration". That the life cycle it has lived or is presently living is found in its rate of vibration. That this rate of vibration, this path or speed of this path that the vibration has been traveling is representing its evolving path, and therefore that its evolution is a representation of its vibration. From first impulse to present mathematical point of force, or number or shall we say price.

"After years of patient study I have proven to my entire satisfaction as well as demonstrated to others that vibration explains every possible phase and condition of the market."

Yes, we hear again Gann was a hard worker, his nature you know, he couldn't do any other way, just a reminder we each must find our way and not get sidetracked on someone else's way. They all lead to the same place, we just see it differently.

When you are ready, perhaps after some time has let this settle into the mind, you may want to go back and re-read the original article and notice what else is there for you. You will see what no one else can see, you will see what is there for you.

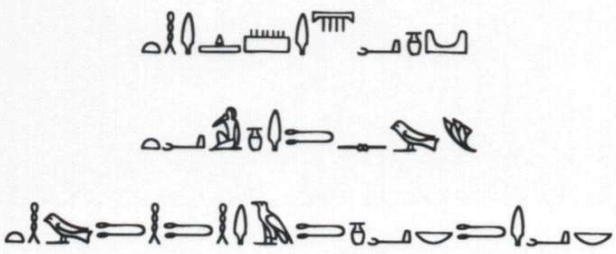

Chapter 4

Exploring the Emerald Tablets of Thoth

There are many
Who are living far below their possibilities
Because they are continually
Handing over their individualities to others
Do you want to be a power in the world?
Then be yourself

Ralph Waldo Emerson
1803 - 1882

THE EMERALD TABLETS OF THOTH

Translation by Doreal

The author, identified here as Doreal, had access through the Masonic Great White Lodge and the Pyramid Priesthood in the 1920's to the records known as the Emerald Tablets. He finished the translation and interpretation in 1925 and it was made public much later.

From the Preface:

The Emerald Tablets...date back some 36,000 years B.C. The writer is Thoth, an Atlantean Priest-King, who founded a colony in ancient Egypt after the sinking of the mother country.

He was the builder of the Great Pyramid of Egypt erroneously attributed to Cheops. In it he incorporated his knowledge of the ancient wisdom and also securely secreted records and instruments of ancient Atlantis.

For some 16,000 years, he ruled the ancient race of Egypt, from approximately 52,000 B.C. to 36,000 B.C. At that time, the ancient barbarous race among which he and his followers had settled had been raised to a high degree of civilization.

Thoth was an immortal, that is, he had conquered death, passing only when he willed and even then not through death. His vast wisdom made him ruler over the various Atlantean colonies, including the ones in South and Central America.

When the time came for him to leave Egypt, he erected the Great Pyramid over the entrance to the Great Halls of Amenti, placed in it his records, and appointed guards for his secrets from among the highest of his people.

In later times, the descendants of these guards became the pyramid priests, by which Thoth was deified as the God of Wisdom, The Recorder, by those in the age of darkness which followed his passing. In legend, the Halls of Amenti became the underworld, the Halls of the gods, where the soul passed after death for judgment.

During later ages, the ego of Thoth passed into the bodies of men in the manner described in the tablets. As such, he incarnated three times, in his last being known as Hermes, the thrice-born.

In this incarnation, he left the writings known to modern occultists as the Emerald Tablets, a later and far lesser exposition of the ancient mysteries...

This is one of many writings available to modern man, as wisdom passed down from previous times and generations. The methods and symbology may differ yet the

information contained is quite similar. We will look at this example of an ancient text, translated in the early 1900's and see how the Law of Vibration is represented.

We will look at a section in Part 12 called The Law of Cause and Effect and the Key of Prophecy. Read it for your own benefit before going on to next section where I will make comments relating it to the Law of Vibration. Again make notes as you are reading and seeing what is occurring to you in your own sphere of knowledge and way of processing.

Part 12:

The Law of Cause and Effect
and The Key of Prophecy

List ye, O man, to the words of my wisdom,
list to the voice of Thoth, the Atlantean.
Conquered have I the Law of time-space.
Knowledge have I gained of the future of time.
Know I that man in his movement through
space-time shall ever be One with the All

Know ye, O man,
that all of the future is an open book
to him who can read.
All effect shall bring forth its causes
as all effects grew from the first cause.
Know ye the future is not fixed or
stable but varies as cause brings forth an effect.
Look in the cause thou shalt bring into being,
and surely thou shalt see that all is effect.

So, O man, be sure the effects that ye bring
forth are ever causes of more perfect effects.
Know ye the future is never in fixation but
follows man's free will as it moves through
the movements of time-space toward
the goal where a new time begins.

Man can only read the future through
the causes that bring the effects.
